>> Is NEC capable of modelling the configuration shown at
>> http://www.vk1od.net/lost/King-22.3b.png (which is the same type of
>> problem as my figure b)?

A point made by King is that if the three half waves are in phase,
radiation resistance will be quite high (one third current required for
same distant field strength), around 316 ohms against 105 ohms for three
half waves not-in-phase. Presumably these figures are for free space.

This effect is certainly observable in models using my Fig a) (though
half the respective resistances due to the vertical over perfect ground).

The feedpoint impedance looks like it might provide a hint as to whether
currents are actually in-phase.

Exploring that thought, an example (to some extent) of King's Fig 22.3b
is the W5GI Mystery Antenna (see
http://www.w5gi.com/images/w5gimsteryantennaschematic.gif) which claims
to be three half waves in phase at 14.2MHz. It is very similar to the
diagram above in King though I note that the phasing sections are 105° in
electrical length.

The W5GI is fed with a half wave (at 14.2MHz) of 300 ohm line, then 34'
of RG8X. W5GI reports impedance looking into the RG8X as 42+/-j18. That
suggests the load on the RG8X is 31+j2 or 70-j18. The feedpoint impedance
should be about the same value due to the half wave of 300 ohm low loss
line. Neither impedance is within a bull's roar of 316+j0, and are so low
as to question whether the three half waves are indeed in-phase. (The
highest impedance that would yeild 42+/-j18 on a short length of RG8X
would be around 80+j0, closer to the not-in-phase configuration than the
in-phase configuration).

W5GI's reported feed impedance seem inconsistent with three half waves in
phase, and questions whether the phasing arrangement works as suggested.

Thoughts?

Owen

Tom Donaly wrote:
> Still using the Tesla coil fella's ideas, are you?

The title of the article is "RF Coils, ..." The block
diagram of a Tesla coil with a top hat is identical
to a 160m mobile antenna with top hat.

> A frequency dependent Z0 is a good trick.

It's no trick - just based on empirical measurements
as explained in the IEEE paper. Measurements proved
that the Z0 of a coil varies with wavelength so
wavelength is included in the empirical formula.
I observed that phenomenon during my own experiments.

> What happens when you double the length of the coil?

Same thing as doubling the length of a stub. At a fixed
frequency, the delay through the coil is (roughly) doubled.

> Does the Z0 stay the same? What if the coil is infinite?

Length of the coil does not appear in the empirical
formula for Z0 of a coil. Coil diameter, TPI, and
wavelength are the variables. Wire diameter would
obviously have some effect but is not included in
the empirical formula.

> Can you make a quarter wave shorted stub with it?

Yes, but you need a ground plane close by. Mininec ground will do.
Here's a 75m Texas Bugcatcher coil loaded with its Z0 impedance
modeled over Mininec ground.

http://www.w5dxp.com/coil505u.EZ

The current phase shift through the coil is clearly visible
by displaying "Load Dat". The delay through the coil (EZNEC)
is roughly proportional to the phase shift, i.e. about 38
degrees. The coil is 0.5 feet long with a calculated VF
of 0.02 so the calculated phase shift (without EZNEC) is
about 36 degrees. That's pretty close agreement.
> If you make it a half wavelength long - keeping in mind the velocity
factor -
> will the impedance looking into the coil equal the impedance of the load?
> How do you attach a load to it?

Here's the Texas Bugcatcher coil modeled at the first (1/4WL)
self-resonant frequency of 7.96 MHz:

http://www.w5dxp.com/coil505s.EZ

I have not experimented with 1/2WL self-resonance. The above
file seems to be 1/2WL self-resonant at about 19.2 MHz but
the 75m Texas Bugcatcher coil, at 19.2 MHz, does not meet
the guidelines for validity given in the IEEE article.

At a 1/4WL monopole's resonant frequency, the forward antenna
current and reflected antenna current are in phase. The two
component voltages are 180 degrees out of phase. The feedpoint
resistance is [|Vfor|-|Vref|]/[|Ifor|+|Iref|] where these are
antenna voltages and currents on a standing-wave antenna.

If the feedpoint impedance is purely resistive it appears
that the two component waves must be in phase or 180 degrees
out of phase.

Thanks. Presumably then if you dial the carrier power down much below -14dBm
you're then going to have a -174dBm/Hz noise floor due to the output
attenuators as Owen mentioned...

Hi Owen,

What you describe is typically called the "reference plane" in
metrology. This is a term that is found in many standard methods of
RF measurement. Most often it is a point that is neutral to the
introduction of new variables (and concommittant error). To achieve
this neutrality, it must be an access point that is reproducible -
hence the association with the connector or flange as these are
controlled points of access. Connectors can be measured separately to
validate their contribution to error and variability as they can
typically be mated to instrumentation whose own connectors have been
validated by more rigorous means.

There are other issues with the reference plane, one of which is heat
transfer through it which should ring bells here.

Aka, "averaging" (for the direct-sequence style of spread spectrum, ala CDMA or GPS).

Still, AFAIK all that averaging can do is to effectively lower the noise floor at the expense of bandwidth (effectively data rate), and the more benefit you'd like to get from that averaging, the more important your sample points become, which gets back to needing as little phase noise as possible on your oscillators. Is there some other angle here?

Hi Joel,

This is an antiquated consideration limited to amplitude modulation,
the same specie as noise. I suppose there are noise products that
fall into the phase/frequency category that lay claim to "primary
factor," but that is a rather limited appeal.

Deep space communications proceeds many dB below the noise floor
enabled through technology that has become ubiquitous in cell phones -
Spread Spectrum. I have developed pulsed measurement applications for
which any single pulse has a poor S+N/N, but through repetition
improves S+N/N response with the square root increase of samples
taken.

Jim Kelley wrote:
> He wasn't measuring "standing wave current", whatever that is.

Sorry Jim, of course he was, since standing wave current
is the primary current that exists on standing wave
antennas like the antenna Roy used to measure his currents.

You keep saying "whatever that is" when it is well
defined in most any antenna book. That you don't
understand standing wave current on standing wave
antennas is just a statement of ignorance - no
offense intended - apparently Roy is just as ignorant.

Perhaps you should study and understand the
difference between a standing wave antenna like
a dipole and a traveling wave antenna like a
terminated Rhombic. Balanis has a good discussion
of such. Here's a quote: "Standing wave antennas,
such as the dipole, can be analyzed as traveling
wave antennas with waves propagating in opposite
directions (forward and backward) and represented
by traveling wave currents..."

An inverted-V dipole can be converted from a
standing wave antenna to a traveling wave antenna
by terminating the ends with a load connected to
mininec ground. Here is an inv_V and a terminated
inv_V modeled in EZNEC. Please look at the "Currents"
display until you understand the meaning of the
phase angles.

http://www.w5dxp.com/inv_v.EZ (standing wave antenna)

Phase angle of the current varies by 2.72 degrees
along each 90 degrees of antenna. This is the current
that Roy used.

http://www.w5dxp.com/inv_vT.EZ (traveling wave antenna)

Phase angle of the current varies by 90 degrees
along each 90 degrees of antenna. This is the current
that Roy should have used.

That was a curious objection to a solution answering a problem as it
was specifically stated. Are there angles to showing noise being
overcome by several means when you offered none?

>>>noise is the primary factor that limits how far
>>>you can transmit a signal and still recovery it successfully.

Again, "qualified" statements such as that should be able to support
themselves with quantifiables.

What "noise" were you speaking about when through the course of this
thread it has most often been confined to kTB than, say, cross-talk,
splatter, spurs, whistlers, howlers, jamming, and a host of others?

What constitutes "successfully?" Is this a personal sense of well
being, or is it supported by a metric?

What constitutes "far"ness? At one point you offered from hilltop to
hilltop with antennas combining to 60dB directivity (but curiously
expressed as SNR). Lacking any quantifiable of what size hills,
shouting can be competitive at some range, and reasonably assured of
being understood to the first order of approximation without need for
averaging.

Spread Spectrum is so ubiquitous that waiting on anticipated exotic
failures of phase noise, on the face of an overwhelming absence of
problems, is wasted time indeed. Communication problems via the Cell
technology are more likely packets going astray on the network than
through the air. Perhaps it is with the clock chips of network
routers where phase noise fulfill this perception of sampling error -
but even there, collision is more likely and the system merely
abandons retries for the sake of economy not for overwhelming noise.

As to sampling error via the net. Time was when 16x over-sampling for
RS-232 was the norm. Going to one sample and transmitting at the base
frequency didn't help until quadrature and more complex phase systems
emerged. Same infrastructure, same noise, faster and more efficient
(not less) communication. Shannon wrote about the bit error rate in

the presence of noise, modulation techniques have improved throughput,
not lowered it.

Radar people for one, also known as pulse-pair radar where data from
multiple returns are compared. The data can be from multiple hits on a
target using the same radar or the data can come from multiple radars.
MDS level improvement below the noise level can be achieved. Its also
used for transmitting data.One other specific use I am familiar with
involves transmition of radar data via radio. So the radar uses it as
well as the mode of transmission of the radar data from the radar to
the user.

>Say I have an antenna that I know happens to provide an SNR
>of 60dB...

Returning to one of the few quantifiables, it would be instructive to judge why it is so astonishing as a point to begin a dive into the discussion of noise figure. In other posts related to deep space probe's abilities to recover data from beneath the noise floor, much less cell phones to operate in a sea of congestion, I encountered the economic objection that such methods cost too much - expense of bandwidth.

Well, not having seen anything more than yet another qualification - how much is "too much?" It is time to draw back and ask how much is enough? What would NOT be too expensive? Replacing qualitative objections with quantitative objections sometimes evokes a horse laugh when the magnitude of the qualitative issue ceases to exhibit much quality.

I won't open this round of enquiry with exotic Spread Spectrum which portends the objection of phase issues with clocks (even knowing that such modulation techniques automatically incorporate slipping to adjust for just such problems). Instead I will slip back some 60 years to the seminal paper published by Claude Shannon who figured this all out (with H.W. Bode) and quote some metrics for various coding (modulation) schemes. Search for "Communication in the Presence of Noise." When you google, search in its image data space for the cogent chart that I will be drawing on, below. Obtaining the paper may take more effort (or simply email me for a copy).

Starting with BPSK and a S+N/N of roughly 10.5 dB, the bit error rate is one bad bit in one million bits. This is probably the most plug-ordinary form of data communication coming down the pike; so one has to ask:
"is this good enough?"
If not, then "SNR of 60dB" is going to have to demand some really astonishing expectations to push system designers to ante up the additional 49.5 dB.

Well, let's say those astonishing expectations are as wild as demanding proof that you won't contribute to global warming if you chip an ice cube off of a glacier - such are the issues of scale when you chug the numbers for BPSK.

OK, so as to not melt down the planet, we step up the complexity of modulation to better than the last solution for "good enough." Let's take the Voyager probes of the deep planets where at a S+N/N of 2.53 dB (in what is called 8 dB coding gain) the same error rate of 1 bit in 1 million is achieved. One has to ask:
"is this good enough?"
If not, then "SNR of 60dB" is going to have to demand some really astronomical expectations.

OK, perhaps this is a problem demanding really deep pockets that exceed the several $Trillion being spent on the past 8 years of Reaganomic neglect. (Why else pound the desk for that extra 57 dB?) Let's go the full distance to the Shannon limit. It will give us that same 1 bit error for every 1,000,000 at -1.5 dB S+N/N. If this isn't below the noise floor, then the problem demanding 60 dB will never find the solution to positively answer:
"is this good enough?"

My question of Which? was directed to Harold's broad brush painting
two different illustrations. Spread spectrum incorporates cross
correlation through slipping the gold code to find a flash. My design
performed a form of forced auto correlation (much like your radar
example, perhaps) but reduced noise as a function of that noise being
uncorrelated to the pulse.

Perhaps this is all saying the same thing at a very fundamental level.
However, I would guess this all hinges on the reduction of noise
following the square root of the ratio of the sample counts.
Conceptually, the distinction between auto or cross correlation is
really of minor consequence.

Ummm...
I could see all of my posts via AIOE to rec.radio.amateur.antenna, so
obviously AIOE aren't doing a blanket block on all posts to this NG
(like they did some time ago, to uk.radio.amateur).

It has been suggested in aioe.news.helpdesk that it is
rec.radio.amateur.policy where most of the abuse happens. I've had a
quick dip into it and yes - there do seem to be the usual collection of
cross-posting of ne'er-do-wells. Maybe AIOE are selectively blocking
only certain news servers or posts from certain ISPs.

As a further check, I'll temporarily switch to AIOE to send this.

Dear Group:

Three conclusions/observations:
1. Noise temperature is the unambiguous way of specifying/describing the noise performance of a receiver.

2. The paper by Costas in December 1959 Proc of IRE is also valuable to this discussion. Be sure to read the follow-up comments.

3. I heard with my own ears Shannon observe that, from an engineering point of view, if one did not have an occasional transmission error one was using a wasteful amount of power. Shannon was a Michigan boy. 60 dB SNR??? Not in fly-over land.

Jim Kelley wrote:
> The only current flowing on an antenna is the current traveling from one
> end to the other.

Since standing waves cannot exist without the underlying component traveling waves, to avoid conceptual blunders, one needs to deal directly with the component traveling waves. Your statement is based on a purely mathematical shortcut which exists only in the human brain, not in reality, and obscures the actual speed-of-light physics necessary for an EM wave to even exist.

The current can be artificially parsed the way you are doing it but that parsing leads to the very misconception under which you are laboring. The same thing happened with w8ji's and w7el's "measurements" involving delays through loading coils. The actual component physics, as explained in any reasonably technical antenna book is:

Total current = forward current + reflected current

Itot = Ifor + Iref (phasor addition)

Reference: "Antenna Theory", Balanis, 2nd edition

Balanis, page 488:
"The sinusoidal current distribution of long open-ended linear antennas is a standing wave constructed by two waves of equal amplitude and 180 degrees phase difference at the open end traveling in opposite directions along its length. ... The current and voltage distributions on open-ended wire antennas are similar to the standing wave patterns on open-ended transmission lines."

Balanis, page 489:
"Standing wave antennas, such as the dipole, can be analyzed as traveling wave antennas with waves propagating in opposite direstions (forward and backwards) and and represented by traveling wave currents, If and Ib in Figure 10.1a."

In a standing wave antenna, e.g. a 1/2WL dipole, there exists a forward wave that gives up about 10% of its energy content to radiation. The remaining 90% of the wave encounters the open end of the antenna and is reflected. So, just as in the case of an open-circuit

stub, we have a forward current component flowing in
one direction and a reflected current component flowing
in the other direction. Many of the mistakes and mis-
conceptions about antennas are based on your false
assertion above.

> I have the ARRL Antenna Book.

:-) The ARRL Antenna Book doesn't even have "traveling
wave antennas" in its index. It does state: "Unterminated
long-wire antennas are often referred to as 'standing
wave antennas'". Please reference a reasonably technical
antenna book like "Antennas", by Kraus. "A sinusoidal
current distribution (on a standing wave antenna) may be
regarded as the standing wave produced by two uniform
(unattenuated) traveling waves of equal amplitude moving
in opposite directions along the antenna."

> I wonder if anyone is buying it?

It doesn't matter if anyone is buying it. What matters
is technical validity. Your first statement above is
technical invalid. Given the free space description of
standing waves of light given by Hecht in "Optics", your
assertion above would lead one to believe that the photons
comprising the standing wave of light must be at rest even
though that's an impossibility (except in the human mind).

Here's what a couple of references say about standing waves.
"Electrical Communication", by Albert:

"Such a plot of voltage is usually referred to as a
voltage standing wave or as a *stationary wave*.
Neither of these terms is particularly descriptive
of the phenomenon. A plot of effective values of
voltage, appearing as in Fig. 6(e), *is not a wave*
in the usual sense. However, the term "standing wave"
is in widespread use."

"College Physics", by Bueche and Hecht:

"These ... patterns are called *standing waves*, as
compared to the propagating waves considered above.
They might better not be called waves at all, since
they do not transport energy and momentum."

>
> Aka, "averaging" (for the direct-sequence style of spread spectrum, ala CDMA
> or GPS).

Actually no. Deep Space Communication (at least that done by NASA) doesn't use any form of spread spectrum. The details can be found in various CCSDS documents (http://www.ccsds.org/), but, basically, at rates below about 4kbps, they take the data and modulate a subcarrier at 16 kHz, then use that to phase modulate a carrier. The mod index is usually such that there's a lot of residual carrier so that the receiver can acquire the narrow band carrier.

A typical acquisition threshold signal requirement is about -154 dBm at the receiver input. Naturally, you can do better.

The lowest rate is a bit less than 8 bps and the receiver bandwidth is in the few tens of Hz range. They also do a LOT of coding, so they get VERY close to the Shannon limit for the channel property. (We, who build the hardware, comment that the coding guys get all excited about eking out another 0.01dB closer to the theoretical limit, and then the spacecraft guys add a foot of coax with a loss of 1/2dB)

BTW, In deep space work, the spacecraft radio usually generates the return carrier so that it has a fixed frequency relationship with the received signal (e.g. fTX = 880/749 * fRX) and is phase coherent. This allows very precise range and range rate measurements to be made, particularly if one measures the received(on earth) signal relative to the (earth)transmitted signal over a time span of, say, 1000 seconds.

Spreading codes ARE used for ranging in GPS and with TDRSS. They were also used for ranging with Apollo, but after that, they went back to sequential tone ranging (because PN codes took too long to acquire) for deep space. PN ranging is coming back into favor. Bepi-Colombo, a mission to Mercury, is using PN ranging for instance.

> you'd like to get from that averaging, the more important your sample points

> become, which gets back to needing as little phase noise as possible on your
> oscillators. Is there some other angle here?

In the deep space comm world, there's two basic strategies.. get a real quiet quartz oscillator (called a USO: Ultra Stable Oscillator) to generate your carrier on the spacecraft; or, regenerate the carrier from the received signal (coherent transponder). The signal on the ground is generated by multiplication from a hydrogen maser, so it's VERY good, phase noise wise. In numbers, a good quality transponder at Ka-band might have an additive Allan deviation of 1E-15 in 100 seconds. To put that in perspective, at 30GHz, you're talking about a phase shift of 0.01 degrees averaged over 100 seconds. Just measuring the performance of the box is a challenge.

Prestage (at JPL) is working on a flight capable trapped mercury ion clock that will provide a high performance frequency reference, and would allow a lot of interesting things to be done.

My means were "reduce the noise figure of the amplifiers in your front-end" and "reduce the phase noise of your oscillators/PLLs/etc." "Averaging the input" is a clear winner here too.

> What "noise" were you speaking about when through the course of this
> thread it has most often been confined to kTB than, say, cross-talk,
> splatter, spurs, whistlers, howlers, jamming, and a host of others?

For the sake of this thread, it's been just thermal and oscillator nose since these are -- AIUI -- what limit traditional analog (AM/FM/PM) communication systems. Most of the rest of what you've listed are certainly real-world problems, but they're (hopefully) somewhat transient in nature and -- as AIUI -- often all lumped into a single "fade margin" when designing the an end-to-end system. E.g., the transmission medium is often modeled with something no more complex than, say, the Friis equation and Rayleigh fading. I do realize that in the real world things like spurs or splatter can end up being very expensive (frequency changes, high-order/high-power filters, etc.) if you're co-locating your radio with many others on a hilltop -- I've been told that if you take a run-of-the-mill radio to a place like Mt. Diablo in California, many of them just fall over from front end overload and cease to function at all.

> What constitutes "successfully?" Is this a personal sense of well
> being, or is it supported by a metric?

Usually something like a 12dB SINAD standard is used for analog modulation schemes or a 1e-3 bit-error rate for digital modulation techniques (before any error correction coding is applied).

> Spread Spectrum is so ubiquitous that waiting on anticipated exotic
> failures of phase noise, on the face of an overwhelming absence of
> problems, is wasted time indeed.

It's not ubiquitous on amateur radio, though.

But yeah, commercially it certainly is, and my understanding is that phase noise in oscillators in a Big Deal for cell sites, requiring much more strigent standards than what a 2m/440 HT's oscillator is likely to provide. The network timing of cell sites is sync'd to atomic clocks via

GPS-disciplined oscillators system as well.

> As to sampling error via the net. Time was when 16x over-sampling for
> RS-232 was the norm.

I've meet many RS-232 routines that don't do any over-sampling at all -- I've even written a few. :-) For most applications the SNR of an RS-232 signal is typically well in excess of 20dB if you don't exceed the original specs for cable length of bit rate. (Granted, as least historically before RS-232 starting falling out of use, it was probably one of the most "abused" electrical interconnect standards in the world, and 16x oversampling certainly would let you go further than simple-minded receivers with no oversampling.)

Let's assume you are correct. Here are a few questions:

1. Given a 90 degree monopole fed against an infinite
ground plane, what would be the phase at the top of the
antenna compared to the phase at the feedpoint for any
instant in time?

2. Why would the feedpoint impedance of a 1/4WL monopole
be more than a magnitude less than the feedpoint impedance
of an infinite monopole?

3. Where does the above current go when it hits the open-
circuit at the top of the monopole?

4. Why is the total energy in the E-field at the top of the
monopole so high?

I don't think anyone stated they cost "too much," just that there is a cost in increased bandwidth, and bandwidth isn't free.

In general the spread spectrum processing gain is proportional to the bandwidth increase over what the original data stream would require without any spreading.

> Well, not having seen anything more than yet another qualification -
> how much is "too much?"

Definitely depends on "the market." You can bet the cell phone developers have sophisticated models of possible radios and the channel and associate with each piece a cost (e.g., bandwidth = $xx/Hz, improving close-in phase noise of master oscillator = $xx/dBc, etc.), and then run a lot of simulations to try to make the average cost of each bit as low as possible. Of course, there are many variables that are impossible to ascertain precisely such as how quickly uptake of new cell services (e.g., 3G data) will be in a given area (as this drives how many towers you put there initially and how quickly you roll out more), how fast fab yields will improve that lower your costs and improve RF performance, etc.

Why Richard, I'm starting to think you don't spend thousands of dollars per meter on your speaker cables. :-) Hey, see this:
http://www.noiseaddicts.com/2008/11/most-expensive-speaker-cable-world-audioquest-audiophile/ -
- $7,000/m speaker cables! Includes, "Spread Spectrum Technology!" :-)

That being said, back in the analog broadcast TV days (oh, wait, not all of them are gone yet, but they will be soon), I believe that "studio quality" NTSC is considered to be >50dB SNR (for the video), whereas people would start to notice the noise if the received signal's SNR had dropped below 30ish dB, and 10dB produces an effectively unwatchable pictures. This reinforces your point that "good enough" is highly subjective depending on how the "information" transmitted is actually used.

You make a good point that the Shannon limit gives a good quantitative measure of how you go about trading off bandwidth for SNR (effectively power if your noise if fixed by, e.g., atmospheric noise coming into an antenna). Shannong doesn't give any hint as to how to achieve the limits specified, although I've read that with fancy digital modulation techniques and "turbo" error-correcting codes, one can come very close to the limit.

> in fly-over land.

I think the counterpoint is that, particularly in mobile environments, you often needed huge fade margins, e.g., 20-40dB wasn't uncommon for pager systems. Hence in systems designed to have, say, an "average" of 30dB SNR (same audio quality as the telephone system, assuming 3kHz bandwidth as well), it wouldn't be surprising to occasionally find you're actually getting 60dB SNR in the most ideal scenario.

Although perhaps designing for an average of 30dB SNR is a little high for a paging system... anyone know? (I'm thinking 20dB might be a bit more realistic.)

> market.

The original example was meant to be more of a "textbook" problem, hence the
lack of elaboration on the specifics of the "market" involved.

> I would suspect that "studio quality" observes other characteristics
> of the signal.

Agreed, I would too.

Yep, very true -- I think this is why you see people legtimately complaining
about the quality of their cable TV even though the cable installation tech
whips out his SINAD meter and verifies it meets spec; the quality of a
transmission can't always be boiled down to just one number.

> . . .

I looked up the section in King, Mimno, and Wing and was pretty disappointed. It's one of my favorite references, and I usually find the explanations clear. But the description of that antenna is pretty vague, with considerable hand waving ("[Operation of coaxial stubs] is much less satisfactory than that with the open-wire stubs. . ." without explaining why). And in the explanation of the open-wire stubs, the authors seem to state that the wires must carry purely differential currents. And their models (Fig. 22-4) do show purely differential coupling from the antenna to the stubs.

I speculate that they really didn't understand how these antennas worked, had discovered that the coaxial sleeve versions didn't work or at least didn't work as well -- and didn't show the proper impedance --, but didn't fully understand why. King, in particular, was and is one of the giants of antenna theory, and leaves us a lifetime of brilliant insight and rigorous mathematical analysis. But at least at the time that book was published, they lacked the modeling tools we have today.

> This effect is certainly observable in models using my Fig a) (though
> half the respective resistances due to the vertical over perfect ground).
>

It surely does. Given the currents on and locations of the end wires, the modification to the center wire can be calculated from mutual coupling considerations. And I think this is a clue that led King, Mimno, and Wing to conclude that something was amiss with the coaxial version.

It would be more compelling if you simply stated the cost for ANY
market. Qualified statements are suitable for Madison Avenue to sell
cheese, but it doesn't make for an informed cost-based decision.

These were software RS-232 receivers, so you make use of whatever timers, edge interrupts, etc. that you have sitting around to first the start bit, load up a timer to then trigger in (what should be) the middle of the bit time for the sample, etc. I've written pretty much the same routines a small handful of times on different CPUs and in different languages.

The first ones I wrote were on ~1MIP CPUs in assembly and were limited to about 2400bps full-duplex if you were also trying to run a reasonably responsive terminal emulator (e.g., wanted to still have 50% of the CPU available for the emulator), whereas more recently I've written them on ~20MIP CPUs in C and can easily do 9600bps full-duplex with only a small impact on CPU usage.

This lesser mortal was encouraged that he noted the difference, but there really was no explanation. My feeling is that to note the difference but to be unable to explain it, other than nebuluous conditions like the coaxial tubes must be large diameter ratio, is incomplete... a problem yet to be solved.

I have come to the conclusion that the coaxial tubes are not simply a relocation of a TL as popularly explained. Over the years, I have accumulated a few projects that were works of art, but didn't work properly... and they all used coaxial phasing sections.

Understood... but, I think after our discussion on this, NEC is not up to the task, it may take a more advanced EM field modelling tool.

My suspicion is that NEC's shortfall is that a TL element does not properly represent the coaxial stub and its interaction with the other elements near resonance, though well away from resonance, it is possible that it may be quite ok. King raises the issues of diameter ratios, and the difference with whether the stub is inboard or outboard of the o/c end... but it is not resolved quantitatively.

Now W5GI does introduce his antenna with the statement "A multi-band wire antenna that performs exceptionally well even though it confounds antenna modeling software".

I know that is almost always a harbinger of bunk, the proverbial "Danger Will Robinson...", but in fairness, it does appear that one modelling package, NEC, cannot adequately model the coaxial arrangement near resonance, though in his antenna, the coax section would be resonant around 12MHz and King suggests it ought to be much shorter (resonant well above 14MHz).

That is not to say there aren't other BS warnings in the W5GI explanation of operation, or claims of performance.

Thanks for your comments, I find this an interesting subject.

Dear Joel Koltner (no call sign):

I know of no site where the classic paper may be downloaded. The paper had a significant influence on how people thought about modulation and frequency allocation. "Shannon, Poison (I can not think how to spell his name) and the Radio Amateur" is the title of the paper. A good library should be able to get you a copy. The same issue had a paper on small, loaded cavities, which became the norm for front end selectivity in VHF communication receivers.

I believe that NEC can do a fine job of modeling any of the variations we've been discussing. But like all modeling systems, it has to be used properly -- the transmission line object isn't an adequate model for either a coaxial structure or an open wire stub, if either is carrying any common mode current. And in these antennas it is, so you can't insist on using nothing more than a transmission line object and then bemoaning that the result isn't correct. The wire stub variation can be correctly modeled as wires. The coaxial structure can be correctly modeled as a combination of a wire and transmission line object. In either case I have high confidence that carefully and accurately measured results will agree closely with NEC predictions.

It doesn't appear this way to me at all. What has led you to the conclusion that it isn't possible to accurately model it with NEC? Again, it's certainly impossible if you use only a transmission line object to represent a structure which has common mode current. There are many ways to build a model which doesn't accurately represent the antenna being modeled. But just because it's possible to make a bad model doesn't mean it's impossible to make a good one.

What is the evidence that results from a properly designed NEC model
disagree with careful measurements of pattern, current, or impedance of
an actual antenna of these types? You've noted that the W5GI antenna
impedance isn't consistent with a correctly phased collinear. I'd be
surprised if the impedance isn't close to what a correct NEC model
predicts -- or that the phases of the currents aren't also what NEC
predicts.

Actually, the title is "Poisson, Shannon, and the Radio Amateur",
Proceedings of the IRE, Dec 1959, Vol 47, Issue 12, pages 2058-2068. The
abstract is:

Congested band operation as found in the amateur service presents an
interesting problem in analysis which can only be solved by statistical
methods. Consideration is given to the relative merits of two currently
popular modulation techniques, SSB and DSB. It is found that in spite of
the bandwidth economy of SSB this system can claim no over-all advantage
with respect to DSB for this service. It is further shown that there are
definite advantages to the use of very broadband techniques in the
amateur service. The results obtained from the analysis of the radio
amateur service are significant, for they challenge the intuitively
obvious and universally accepted thesis that congestion in the radio
frequency spectrum can only be relieved by the use of progressively
smaller transmission bandwidths obtained by appropriate coding and
modulation techniques. In order to study the general problem of spectrum
utilization, some basic results of information theory are required. Some
of the significant work of Shannon is reviewed with special emphasis on
his channel capacity formula. It is shown that this famous formula, in
spite of its deep philosophical significance, cannot be used
meaningfully in the analysis and design of practical, present day
communications systems. A more suitable channel capacity formula is
derived for the practical case. The analytical results thus obtained are
used to show that broadband techniques have definite merit for both
civil and military applications.

> any spreading.

For very low level signals spread spectrum doesn't necessarily buy you much. If you use 10 times the BW, you have 10 times the noise, so your received SNR is worse by a factor of 10dB. But you get 10dB of processing gain when you despread, and your output SNR is the same as it was before.

Of course, you consumed some electrical power on both ends to spread and despread things. wideband amplifiers are less efficient than narrow band ones, as well. Saturated amplifiers are more efficient than non saturated amplifiers.

In general, the most efficient (considering power consumed on both ends) transmission is a very narrow band signal, where the bandwidth is just wide enough to contain the required data rate.

This drives you to things like BPSK, GMSK, and QPSK. Ideally, the signal spectrum would be a nice fat rectangular pulse.

In the deep space probe business, watts count at every step of the way.

> error-correcting codes, one can come very close to the limit.

Actually, state of the art is probably Low Density Parity Check (LDPC) codes, as far as approaching the limit. They've become more practical because digital logic is becoming a lot cheaper (in a nanowatts per bit sense) to do the coding/decoding. They're also unencumbered by the patents for turbo codes.

http://en.wikipedia.org/wiki/Low-density_parity-check_code

And the payment of a suitable fee to the folks who OWN the turbo codes
at France Telecom
http://www.francetelecom.com/en_EN/innovation/intellectual_property/turbo_codes/
http://www.spectralicensing.com/licfaq.htm

Note also that turbo and LDPC are really suited to longer block lengths
(1000 bits and bigger). For small block lengths, codes like Hamming
might be better.

Reed-Solomon combined with Viterbi decoders of convolutional codes are
also popular.

Note that in deep space, at a bit rate of 8 bps, you might not want to
use a code with a 1000 bit codeblock..

Taking the W5GI as an example, here is a deck that models the coaxial stub section as a conductor of 5mm dia, whilst the wires for the other sections are 2mm diameter. I have calculated the impedance looking into 16.5' of RG8X (W5GI's specified stub) as 14.5-j179 at 14.2MHz, and inserted that load in both of the segments where the o/c end of the stub is located. I have not used a TL element, rather I have separately calculated the input Z of the stub using the technique used at http://www.vk1od.net/calc/tl/tllc.php , that should be more accurate than using a lossless TL element.

The model assumes an effective balun, ie that there is no common mode feedline current since I have not provided such a path.

This model indicates out of phase operation of the antenna, a multi lobed pattern and feedpoint Z of 115-j179. (Although there is a half wave of 300 ohm line in between, this feedpoint Z would cause VSWR=8 on the 50 ohms line.

I think that I have dealt with the common mode path properly.

Try as I might changing stub lengths etc, I cannot get this configuration to deliver in-phase operation of the radiator.

I suspect the model is not valid.

Actually all 3 of your first posts eventually showed up on Mixmin.
Apparently the Sysop was on vacation for a few days and there were no
new messages until Wednesday. My Monday message didn't go out until
Wednesday either.

I normally use AIOE and switched to Mixmin to see if our messages would
go both ways. I haven't noticed any recent problems at AIOE.

I'm very naive in these matters. Could a coaxial stub be modeled as a cage of wires around the center conductor? Would the orders of magnitude difference between shield/center distance and wire lengths cause problems?

I'm not really the one who is having the trouble. I can still post OK to
rec.radio.amateur.antenna using either my normal Demon news server, or
AIOE. It's some others who are finding that AIOE doesn't work, and they
are getting error messages.

With AIOE, the unwary can innocently fall foul of one of their several
'slap your wrist' rules. It's very easy to get blocked for 24 hours if
you send two identical posts - as you might do if, for some reason, the
first post fails to appear, and you send another.

The only indication from AIOE themselves as to whether they are
employing some other sort of blocking to rec.radio.amateur.antenna is
the following cryptic message on the aioe.news.helpdesk newsgroup:

"closed due some sort of large past abuse
articles are rejected by cleanfeed so error code is duplicated"

(which I don't really understand). They don't seem to be very
forthcoming with any further explanation. But, as I said, this problem
isn't affecting me personally.

From: Owen Duffy <none@no.where>
Message-ID: <Xns9BDAEB77E6B1nonenowhere@61.9.191.5>
Source record: 16758

Roy,

I have spent a lot of time exploring different modelling options over recent weeks.

One view that one might take re my fig a) is that at connection of the stub with the main vertical, the stub offers low impedance to common mode current and high impedance to differential current. It leads to thinking of it as a kind of mode trap that guides the system into in-phase operation.

I have played around with ways of trying to represent that without using the wire segments of the stub.

One method was to place a transformer with only one centre tapped winding. The top and bottom of the winding connect to the upper half wave and the lower quarter wave respectively, and the centre tap connects to a horizontal quarter wave. My thinking was that this structure provides low impedance to common mode current on the horizontal section, but a high impedance to differential input to the top and bottom of the transformer winding.

The model achieves reasonably good in-phase operation, but works best with about 0.35 wave horizontal. I have used an NT card to insert the transformer windings in the two segments. Here is the deck.

```
CM
CE
GW 1 15 0 0 0 0 0 5 0.005
GW 2 15 0 0 5 0 0 15 0.005
GW 3 15 0 0 5 7.2 0 5 0.005
GE 1
NT 1 15 2 1 0 0.01 0 -0.01 0 0.01
GN 1
EK
EX 0 1 1 1 0
TL 1 15 2 1 100 0
FR 0 0 0 0 15 0
EN
```

I then tried changing the horizontal section to two opposed radial wires, and found that worked well with each radial being about 0.2 wave long.

```
CM
CE
GW 1 15 0 0 0 0 0 5 0.005
GW 2 15 0 0 5 0 0 15 0.005
```

```
GW 3 15 0 0 5 4 0 5 0.005
GW 4 15 0 0 5 -4 0 5 0.005
GE 1
NT 1 15 2 1 0 0.01 0 -0.01 0 0.01
GN 1
EK
EX 6 1 1 1 0
FR 0 0 0 0 15 0
EN
```

One can achieve similar outcome by wiring an appropriately phased zero length TL between the segments each side of the horizontal wire.

If these models indicate that the common mode path on the horizontal wire is important, one loses control of the length of that in the case of the coaxial configuration because there isn't an o/c end indpendent of the vertical conductor.

The coaxial construction gives the opportunity to create a high impedance to differential current between the adjacent segments, but lacks the ability to create a low impedance common mode path independently of the vertical structure.

Thoughts?

Answering a question with a question is a well known
diversion. Please answer my questions and you will
automatically answer yours.

Here's some more: How can a current that changes
phase by 3 degrees in 90 degrees of wire be used
to measure the EM wave delay through the wire?

How can that current be used to measure the delay
through a coil positioned in the middle of that wire?

How fast does EM wave energy travel through a wire?

Dear Jim:

I am obliged to you for the title correction. My memory might not be
what it was. Thanks also for the abstract.
While the paper (again from memory and poked by the abstract) is written
in terms of SSB/DSB, a main issue is that of vector addition of copies of a
signal with noise and interference not being coherent. One ends up with a
system that is resistive to noise and interference up to a point where it
stops working.

Ah Jim!

You have the essence of Cecil's (r) Sub-optimal Conjugated Hypothesis
Information Transform before you, the SCHIT (c) model.

He has taken the ordinary postulate of current flow, conjugated it
into a new hypothesis through his sub-optimization. By removing
random bytes, it becomes more intelligible (I will take a stab at it
here):
1. a 90 degree monopole fed against an infinite ground plane
2. the feedpoint impedance of a 1/4WL monopole
3. current go[es]
4. the total energy
now makes perfect sense and whitens your teeth at the same time.

Returning to the process - through sub-optimization by adding
bafflegab, the future deconstruction (posts that would follow the one
above and for which I have already deconvoluted) would find Cecil

eventually unwinding the original conjugation, proving he was right by proving you right - except you were wrong in what you "thought" (the information transform) because he thought you were wrong.

A double conjugation which reveals the source of this side thread.
Deconstructing the bafflegab by random byte dispersal gives us Cecil's
information transform:
>what I am smoking isn't good enough.

[gad, this is so easy I could be double-dipping AIG bonuses and

>

Ouch, the signs of the Y values should be the opposite, so

NT 1 15 2 1 0 -0.01 0 0.01 0 -0.01

Leakage reactance is usually +ve, so Y11 should be -ve, etc.

It has a similar effect, but correct signs is better.

Apologies.

Owen

Much longer block length than typical R-S. Also, the way the check
bits are generated is different. Each check bit isn't formed by
combining ALL the source bits, just some of them (obviously a
different "some" for each of the check bits), hence the name Low
Density. Both are usually roughly rate 1/2.

1853. vertical antenna loading coil vs toroid

Newsgroup: rec.radio.amateur.antenna
Date: 2009-03-28 15:46:20 UTC
From: vo1bbn@gmail.com
Message-ID: <d58b6696-b16a-4681-a70d-6cb33be54b84@e5g2000vbe.googlegroups.com>

I am doing some design with vertical antennas for the low bands 40/80/160M. I require a somewhat large reactance on the element to help load it on 160M, (40&80M) are working somewhat satisfactory now with the design i am using. The required reactance that i need and the size it would be using a coil (with the materials that i have right now) may not last a winter storm in VO1 land when loaded with ice or snow in 90km/h wind, so my question is, has anyone had experience using a toroid wound with the correct amount of reactance installed on the element to to achieve resonance instead of a coil and how it has been for them.

I've only one data point based on measurements made
at a California 75m mobile shootout.

K7JEB had this one mounted on a full-sized pickup.
An 8.5 foot whip using a 75m Texas Bugcatcher coil
at the base outperformed my antenna by +7dB.

I had this one mounted on a full-sized pickup.
An 11.5 foot whip using an SG-230 autotuner at the
base.

Not exactly the comparison you are seeking but the
SG-230 did use #2 iron powder toroidal inductors.

One might assume that the 6 inch long air-core
bugcatcher coil contributed more radiation than the
toroidal inductors. Seems to me the large air-core
coil occupies a greater number of degrees of antenna
than does toroidal inductor. This could be proved
(or disproved) by making delay measurements on both
coils using traveling wave current.

Previous such measurements are worthless for such
because the total current used was primarily standing-
wave current and was changing phase by only ~1 deg
for every ~30 degrees of antenna wire or coil.

Thanks for your reply and the information you provided, it was very
useful as well as the link, it will take me a bit to check it out LOTS
of info there as well.
I'm trying 40/80/160M trap vertical ,i'm experimenting with the low
pass filters in the vertical as coil and cap hats as opposed to coils
and coax capacitors or mica caps which ever. I would like to use the
hats to distribute the current along the radiators more uniform as
opposed to linear. The insulator i have on hand for the top hat is

physically not long enough for the air core inductor, this is why i was wondering about the toroid at the top. 40/80M works great for dx with a 100W not bad on 15M either despite propagation lately. I should also mention its noisy on rx, i see it sometimes has 40db more noise then the loops that i used for rx, thanks again, 73 vo1bbn

I have something simular and used a FT-240-61 torroid which I happened
to have to build a tapped inductor with a pair of relays to switch it
in/out for 80/160.

The antenna analyzer and radio say it seems to work OK.

Just be sure to pick a material appropriate for an inductor at those
frequencies and a size appropriate for the power you intend to run.

In most applications you'd be concerned about the inductor Q, since higher Q means less loss for the same inductance. You probably won't be able to get as high Q with a toroid as you will with a good air core inductor.

But Tom, W8JI pointed out that with mobile antennas on the low frequency bands, the ground loss is so much greater than loading inductor loss, the latter isn't usually an important factor. It'll be difficult to get really low ground loss with a fixed antenna, too, so a toroid should work just about as well in practice unless you have a very good ground system.

You don't, though, want the Q to be outrageously low. And that can happen if water gets between the turns. (That's also true of an air wound inductor.) So I recommend putting it into a container or coating it to keep that from happening.

I built a toroid-loaded quarter wavelength (half length) 40 meter dipole for Field Day, and measured the gain relative to a full size dipole. The loss due to the inductors was less than a dB.

Expect a very narrow bandwidth if the loss is low.

Thanks for the information, nice to see others have done some work
with this in the past.I could do the switch relay and use the same hat
on 160 as i am now on 80, this overhaul length would be about 45 feet
not bad on 80 but i'm think a little short for efficiency on 160, with
the insulator i have on top of the 45 feet i can go another 12 feet to
the 160M hat. 57 feet overhaul to see how that works out. I do have an
option for an 18 feet fiberglass on that for 75 feet total but would
like to stick to 57 feet max any higher than that it will be quite
noticeable with the sun on the fiberglass over the tree line, i will
consider though your thought maybe not worth the gain in efficiency to
go the other 12 feet to the 160M hat, its maybe about 8-10 electrical
degrees in vertical radiator to the 160M top hat, thanks again great
info,73 vo1bbn

thanks for the consideration on the topic of the Q, for the 40M
vertical i have over 0220khz of <2:1 swr on 80M about 160khz, i've
tried a shunt resistor to change the bw on the 80M but didn;t really
do much with it before 160M was going through my mind. If I get
50-80khz bw on 160M, i can work with that to do some testing it was
orginally designed for 40/80M which works ok but now i would like to

try 160, thanks again for the info, 73 vo1bbn

1860. F/S Very LARGE Log Periodic antennas

Newsgroup: rec.radio.amateur.antenna
Date: 2009-03-29 00:12:53 UTC
From: sawman02@yahoo.com
Message-ID: <48c97444-e1ce-49db-9874-ec70a54a7dd3@e38g2000yqa.googlegroups.com>
Source record: 16784

This antenna is, in fact, a system of two Log Periodic antennas. The Mirage/KLM C6-12-8 and the Mirage/KLM 10-30-7. When installed on one tower and fed in series with one 50 ohm feed line, the system becomes the Mirage/KLM C6-30-15-LPA. This scheme offers several advantages. Performance of the system is equal to an antenna with a 76 foot long boom. In addition the two antennas can be mounted on separate towers and/or fed with separate feed lines for even greater flexibility with no loss of performance.

Specifications:

Frequency of operation: 6 to 30 MHZ

Elements of system: 15

Element length (Max): 48 feet

Gain: 5.5 dBd minimum to 8.0 dBd

Front to back: 15.0 dB typical

Feed Impedance: 50 ohms unbalanced (Use 4 4:1 Baluns)

Boom Length: C6-12-8 = 46 FT.
C10-30-7 = 30 FT.

Turning Radius: 33.0 Ft

Asking $500.00

Please e-mail any questions to w2npt@arrl.net THIS ANTENNA SYSTEM IS ON THE GROUND READY FOR PICK UP ONLY IN NORTHERN NEW JERSEY

Hi all

I have a Solarcon I-max 2000 for 10 metes.

My question is about the ground plain legs. Would it work any different if the ground plain legs were horizontal rather than on a downward angle?

The bracket that came with it is rusted badly and it would be easer for me to mount them horizontal on a new home made bracket.

Thanks

Hi Andy:

I don't know much about that antenna, but drooping the radials, (ground legs) is a common way to raise the impedance of the antenna.
Most ground plane antennas resonate impedance is less than 50 ohms and drooping the ground radials raises the impedance up to 50 ohms. The 2 best ways to find it out is:
1 model the antenna in software
2 try it and find out what happens.

I vote for no. 2 as it's Ham radio at it's best.

Hi Jon,

I offered that model long ago in this thread - as it was ignored, I
was condemned to use it myself.

I had given some thought ahead of plunging ahead into the model (it
was originally a thick radiator for which the model was perfectly
suitable). The concept of coaxial tube shielding proceeds along the
premise of the shield supporting separate conduction paths, isolated
by skin effect of the tube conductor. That is, the currents of the
shield on the inside surface are separate and distinct from those on
the outside surface. I knew full well that NEC would not maintain
that distinction for any wire in a cage simply because it lacks the
ability to report separate currents along the same wire as would be
found in this inside/outside tube surface.

The model I published and provided the link to here in this thread was
not strictly faithful to the concept of the cage model for a coaxial
tube, however. I enhanced it into roughly 1000 wires emulating a cage
10.5M long, 2M in diameter, with hoops every 33cM along its length,
and closed at both ends. Think of it as a roll of mesh with a 1 foot
grid capped at both ends with radial wires. Within it is a length of
wire that is roughly 10M long and isolated from the cage at both ends.

With the wire loss set to perfect, the central wire was driven and it
was as though no shielding cage existed. Within tenths of a dB, the
radiation characteristic across HF was roughly the same as from a
simple wire dipole. Conceptually, it would appear that the Faraday
shield does not exist in the world of NEC.

When I introduced the copper setting for wire loss, this assemblage
exhibited the following "loss"

Hi Jon, Richard,

I considered the same, and I did model some simpler structures to explore some possible effects.

Although it would be possible to create a cylindrical structure of GW elements, my concern was that it would not have the near complete isolation of inner and outer surfaces of the outer conductor, that it might need be be very large in diameter in terms of wavelength, and that it moves further away from practical commercial coaxial lines.

I have been quiet here, but have been modelling and writing notes up on the results. I have asked for comment on a draft model, and subject to that, I will post the URL for further comments, hopefully in a day or two.

The effort was really about understanding whether the stub in my fig a) could simply be replaced by a pure differential mode transmission line, and whether that could then be coaxially collinear with the main radiator. I think the answer to the first question is NO, and that drives the answer to the second question.

Owen

Andy,

I "Googled" the antenna and this is what I found:

Solarcon I-max 2000
This antenna tunes from 20 upto 10 Metre, making it perfect for HF operation

a.. Solarcon 5/8 Wave
a.. Base Station Antenna
a.. End Fed 5/8 wavelength radiator
a.. Extended I-Max (current Maximum) Center Section
a.. Radials are Not Required!
a.. Wide Bandwidth
a.. High Power 5000 Watts.
a.. Outstanding Gain
a.. 24 Feet Long
a.. Wind Rating - 100 MPH

73
HH

The Solarcon antenna derives no benefit from using radials. Spare yourself the drudgery and effort. Some folks were feeding upon the ignorance of CB users and were trying to create mystical/magical options they could sell for more profit. The basic antenna is surprisingly the good. The rest of the

junk is unnecessary.

Thanks all, for your input. I'll stick it up on the mast this weekend and try it without any ground plain legs to start with. It will look a lot tidier without legs on and I won't have the problem of having to put up a longer stub mast to accommodate the ground plain legs.

Hmm
How do you know for sure that the arms are not part of the radiator ?
The specs say no "ground" plane required which suggests no buried
wires
as artificial ground is supplied

Where are the radials on this antenna? The pix I've seen don't show any,
so it looks as if someone was tricking the antenna out. Probably to no
avail.

As likely as not, the thing was designed without radials, so it doesn't
need them. I'd put it up without them, measure the SWR, and if it checks
okay, you're good to go. The antenna will operate as well as it will
operate.

Hi Andy,

While the question of radials hinged on the match, sloping radials
raising the resistance; what you propose may raise it further yet. The
radials serve a purpose. If you remove them, you need to replace
their function by some other means.

This isn't bad, but it needs to be recognized and anticipated.
Basically you are moving towards a vertical dipole (albeit with one
leg at 5/8ths length). Even more, the lower leg will probably be
driven into ground (not the normal convention for vertical dipoles).
Even more, more, there is the drive line. It will contribute its own
variation to the drivepoint impedance unless you have it properly
choked.

The long and short of it, is that it may take some experimentation for
the right length of the supporting mast if you tie off the drive point
to it (instead of simply using if for support).

If you don't choke the feedpoint, then your coax will become part of
the tuned system. This is not bad (unless it gets back into your
equipment in the shack, or in the house in general), but it will
introduced a hard to control variability.

The page says the antenna is a .64 wavelength. But isn't the extra length just compensating for the change in VF due to being inside the fiberglass tube? Looks to be made well enough for sure.

> How can that current be used to measure the delay
> through a coil positioned in the middle of that wire?

Assuming the antenna is 90 degrees in length, the relevant currents can be measured, the maximum is known and the minimum is zero, then: According to the plots that I've seen, the standing wave pattern will show a discontinuous change in amplitude at positions where there is an abrupt change in phase of the traveling waves. Since it's fair to assume propagation velocity is the same in both directions, waves would be phase delayed by the same amount in both directions at a discontinuity, and the combined sum of the two delays would account for the total delay and for the resulting change in amplitude. Since a standing wave can be considered an amplitude vs phase plot (where both phase and amplitude vary with position) and the amplitude is known on both sides of the discontinuity, the amplitude on each side of the discontinuity relates functionally to a corresponding phase on the abscissa of the standing wave curve. The total change in phase is equal to the difference in phase on the two sides of the discontinuity. The phase delay for each traveling wave is then half the total phase change. Whether all of the assumptions are true for the cited case, I don't know. The assumptions that you've made are not always clearly or completely communicated, but would obviously weight heavily in the results. This is also true for EZNEC results.

Why not take some actual phase shift measurements for yourself?

I have already done that at my previous QTH and
reported it two years ago. Remember these graphs
from software that you recommended?

http://www.w5dxp.com/travstnd.gif

My dual-trace scope measurements agreed within
the accuracy to which I could measure.

Point is that the delay through a transmission
line, a wire, or a coil is the same no matter
what type of current (standing wave or traveling
wave) is flowing. EM waves are EM waves. If the
current is primarily standing wave current with
essentially unchanging phase, the phase shift
in the standing wave current is unrelated to the
delay through the T-line, wire, or coil. Yet
standing wave current phase is what was used to
"prove" a 3 nS delay through a 100T, 2" dia, 10TPI
coil on 75m. If traveling wave current had been
used, as I did on my 75m Texas Bugcatcher coil,
the delay would have been shown to be ~26 nS.

In a 1/4WL monopole or 1/2WL dipole, the total
current is about 90% standing wave current.

Did you take a look at the current phase in these
two inverted-Vs?

Beeep. Check this very newsgroup. I already responded
to that posting. You didn't answer the question. We
are not talking about discontinuities. We are talking
about a straight 1/4WL piece of wire. So allow me to
keep asking until I get a reasonable response:

EZNEC says there is ~3 degrees of phase change in the
current in 90 degrees of monopole. How can that current
be used to measure the delay through 'n' degrees of
monopole?

For instance - in 30 degrees of monopole, the current
shifts phase by one degree. What *exactly* does that
indicate? Wouldn't the delay be more accurately
measured by comparing the ARCCOSine of the amplitudes?

1884. NEC modelling of lossy transmission lines

Newsgroup: rec.radio.amateur.antenna
Date: 2009-03-31 22:31:56 UTC
From: Owen Duffy <none@no.where>
Message-ID: <Xns9BE060F7FBD43nonenowhere@61.9.191.5>
Source record: 16660

TLLC (http://www.vk1od.net/calc/tl/tllc.php) and TWLLC (http://www.vk1od.net/calc/tl/twllc.htm) have been enhanced to calculate two port S parameters and Y parameters for the described transmission line section.

The parameters are independent of load. They are dependent on line type, frequency, and length and are only calculated if no mismatch is specified (to emphasis the independence of load). Because transmission lines are repiprocal two port networks, only S11 and S21 are displayed, S22=S11 and S12=S21; and likewise for the Y parameters.

An example use for the two port model is NEC NT network cards which use Y parameters to describe the network.

NEC model of G5RV with NT cards for lossy transmission line (http://vk1od.net/blog/wp-content/uploads/2009/03/g5rv-nt.nec) is an example NEC model that uses two NT cards to model the open wire line section and then coax for a G5RV at 3.6MHz. NEC will include the transmission line losses in the ‘Network Loss’ category under the Power Budget heading in the NEC output report, and calculated Efficiency will include the effects of the transmission line loss. The impedance seen by the source in this example includes the effects of transformation by the lossy line sections.

For convenience with NEC, the calculator output also contains an NT card prototype with the Y parameters for the transmission line section.

Hi Owen,

This is a lot to digest at this time, but at least it is all in one
place and done well.

You offer several many solutions (to what are arguably straw men
hypothesis such as the W5GI mystery antenna) and there are certainly
gaps that beg filling: Fig. 2 is rather anemic as is the original
supporting commentary.

I offered a comment long ago that my best guess was that phasing would
seem to separate your two examples. That seems to have been both
vindicated and rejected through the numerous examples - I've lost
track of the focus.

I will have to revisit the comments in this thread and tie them to the
cogent points of your page.

Hi Owen,

I can well appreciate the issue of common mode driven by coupling to the field. The work-arounds I would have expected Roy to have offered would have been a combination of the TL faculty of NEC for the differential mode, and an appendix-like wire to support the common mode contribution. The lack of this discussion where it often appears in other threads leaves me to wonder if other issues are being discussed here; hence my problem with topic focus.

As for the modeling of a coaxial transmission line by wires, I have fairly convinced myself that that approach is thoroughly dead (having seen no contrary response to my comment about the concept of a Faraday Shield being unknown to NEC).

By these two, it would seem that modeling coaxial components in NEC is intractable and claims applied to their use will only be proven/disproven in the lab or the field.

Proceeding from this last conclusion, I cannot see any purpose to the comparison of the two colinear representations. You certainly bring many issues to bear, but except for vague references that are 60 years old, I don't see any solution to your original questions (which is where I thought the focus resided).

>
> I have absolutely no idea. Sounds like you've made an error somewhere.

Nope, there's no error. Roy once verified that the total
current in a standing wave antenna, like a dipole, changes
phase very little over the 180 degree length of the 1/2WL
dipole. Yet, he used that same total current with its unchanging
phase to try to measure the delay through a loading coil.

In "Antennas", Kraus' plot of the total current on a dipole,
(Figure 14-2 on page 464 in the 3rd edition) also shows that
same 3 degree phase change in the total current over the 180
degree length of a 1/2WL dipole thus agreeing with EZNEC.

If one cannot detect a phase shift in 25 degrees of 1/4WL
monopole or 1/2WL dipole using the total current, how can
one expect to detect a phase shift in 25 degrees of loading
coil using that same constant phase current?

Jim Kelley wrote:
> According to the plots that I've seen, the standing wave pattern will
> show a discontinuous change in amplitude at positions where there is an
> abrupt change in phase of the traveling waves.

There's no discontinuity because the 180 degree phase shift
occurs at an amplitude zero crossing, i.e. when the phase
shift occurs, the amplitude is zero. But please note the
phase shift doesn't occur at all on a 1/4WL (or shorter)
monopole.

> Since a
> standing wave can be considered an amplitude vs phase plot (where both
> phase and amplitude vary with position) ...

For the standing wave function, I(x,t)=Io*cos(x)*cos(wt),
the phase at any point x, for a particular (t), doesn't
change phase. Set t=0 and vary x to see what happens.
Only the amplitude changes with x. That's why standing
wave current phase cannot be used to measure the delay
through a loading coil.

Butternut advertises a multiband (40,20,15,10) resonant radial system
(model STK) for use with their verticals. It is made from twinlead,
with notches in it.

See http://www.bencher.com/pdfs/00361ZZV.pdf

How does this work? Is there design information available anywhere so
one could build their own system for other bands?
How does its performance compare with normal radials?
Bandwidth, efficiency etc.

Depends on what you want to do with modeling coaxial components. A wire to represent the (radiating)outside, and an appropriate NT or TL to represent the (non radiating) inside works fairly well.

If you actually want to model the cable itself (including the fields inside), I suspect it won't work so well. MoM codes in general often don't deal with modeling the fields inside closed boxes very well.

I suspect that the cases where it doesn't are basically in the category of things that MoM codes don't do well with in general, and you need to go to a different kind of model (FDTD? etc.)

>How does this work?

Hi Bob,

Pretty much in the fashion of regular radials.

>Is there design information available anywhere so
>one could build their own system for other bands?

Start with the nominal quarterwave length. Put it in the expected
environment. Measure SWR. Trim or lengthen as appropriate.

>How does its performance compare with normal radials?

Normal being? Compared to 120 quarterwave radials?

>Bandwidth, efficiency etc.

Oh! Bandwidth: probably wider.

Efficiency: probably much less.

Bandwidth and efficiency for ONE radial (or two, or three, or four...)
in this circumstance is normally in an inverse relationship when close
to the ground.

SILENCED HAMS MEAN SAFER COUNTY

-from the Los Angeles Press-Telegram (4/1/2009)

San Luis Obispo county supervisors took drastic and unprecedented action yesterday by passing an ordinance that would prohibit amateur radio operators, known as "hams", from operating their transmitting stations. The measure was put in place to eliminate what officials said were health risks associated with transmitters located close to children. A legal struggle is expected.

By a vote of 4 to 1 with one abstention, the governing board of SLO county took action aimed at addressing a recent Stanford University study that showed a correlation between ham radios and attention deficit disorder and hyperactivity in children, as well as nagging reports of interference caused by radio hams operating their high-powered transmitters in residential neighborhoods.

"Our primary responsibility is to provide a safe environment for children to live without the dangerous effects of radio waves constantly bombarding them and causing proven neurological and psychological problems," said E. Duane Nyborg, an attorney who represented the county in several court cases in the past year. "Hams are not the only culprits, but they are usually in very close proximity to children and are no doubt a major contributor to the health problems we've been seeing. The interference is just the last straw that convinced the county that something had to be done about it."

Atascadero city manager Laura Lopez said that she has seen a tenfold increase in the number of complaints of interference from ham radio operators in the last six months. New housing developments which have dramatically increased the population there and placed homes unusually close to each other are the predominant contributing factor. Similar conditions exist in most of the county.

"We have radio hams getting into toasters, electric pianos, light bulbs, everything, from their powerful transmitters that cause all this static. Many of our citizens can't use basic appliances or watch television because of all the junk that the hams are broadcasting," she told the Press-Telegram by telephone.

Hams can't say they didn't see this coming. They were warned by the county last year that if they did not submit to a check of their stations by officials, they would have limits imposed on their operation. Few consented to the searches, which most decried as invasive. But nobody expected a total ban on transmissions.

"This is outrageous. You'd better believe we're going to fight back and win. This is a totalitarian seizure of our rights that is totally illegal and can't stand up," said Frank Wilson, a local ham club president. He said there were no formal plans for an appeal yet but preparations were underway.

Wilson claims that a federal preemption of local zoning ordinances, called PRB-1, delineates three rules for local municipalities to follow in accomodating antenna structures such as are used by hams. But Nyborg says that PRB-1 applies to antenna structures only, and not the transmitters used to feed the antennas with a radio signal. "We know all about PRB-1. That's why we said nothing about antennas. This law is not about antennas. It goes after the root of the problem, which is the transmitters that put out huge signals that get into the brains of our children and short-circuit them out. Those are the facts, that's what the scientific evidence points to," he said at a news conference called shortly after the county's action.

In 2008, a group of researchers in the school of Environmental Health and Safety at Stanford published their findings that exposure to ham radio signals for three hours per day increased the risk of hyperactivity and related disorders by 10% in children aged 12 and under. This effect was seen when a typical ham radio was turned on up to ⅛ mile away. The San Luis Obispo city office says that up to 11,000 children in that city live that close to a ham radio station.

The Stanford study showed that frequencies around 3.5, 7, and 14 Megahertz were the most harmful, but that the danger existed all the way up to 450 Megahertz and above.

"We know where the hams are, that information is easy to get on the Internet," said former mayor of Paso Robles and current county supervisor Anthony Wu. "Most of these guys are running one hundred watts of power, that's an incredible amount of radiation, and you can't block it out. It enters your house, it gets into your body and does a lot of damage there."

Cindy MacMahon, 41, of Morro Bay, soccer mom of two and volunteer at city bake sales, praised the action by the board of supervisors and looked forward to radio-free days ahead. "I'm always getting interference on my TV and stereo that I'm sure is from the guy down the street with his big tower. I don't know why they even allow those big, ugly things. I know that my kids are harder to control when he turns that thing on and I've been saying that for three years."

Most area hams were totally unaware of the new law and Wilson believes there will be a revolt when they discover it. "I will be speaking about it at our club meeting on Friday. We would normally disseminate the information by radio, but of course that's illegal for the moment."

Amateur radio operator Clay Collins of Pismo Beach, was incredulous. "We provide free emergency communications for the county, we assist the police department, we help out several times a year on all manner of public events, and this is the thanks we get. Someone is badly informed. Next thing you know, we'll be accused of being responsible for global warming." Another radio ham who identified himself only as "Deke" said that although a number

of hams were mobilizing to do what they could he was pessimistic. "I actually know that Nyborg guy. He walks around twelve hours a day with a cell phone up to his head and yet he's worried about the tiny amount of radiation from my transmitter." Deke claims that the frequencies of a cell phone are close to that of a microwave oven. "You hold a [cell] phone up to your head, you're cooking your brain slowly," he warned.

Collins, a ham of fifty-three years and grandfather of six, lives in a housing tract with a homeowners' association that already regulates ham radio operators. He says that restrictive HOA agreements exacerbate the problem. "By prohibiting high antenna towers, [the HOA rules] force me to place my antennas lower and closer to my neighbors, and force me to use higher power to make up for the difference in performance." He said that his antenna, which is located in his attic, creates far more radiation on the ground than if it were up on a 50-foot tower-the same type of tower Collins applied for in 1997 but was denied a permit for. Hams are required by the FCC to keep track of the amount of radiation from their antennas but Collins' station is far below the allowable limits, he says. "In the next earthquake, all of my neighbors will be running to my house to send messages out to their loved ones in other places. I hope they remember this."

Dick Henley, a member of the Electronic Industries Association who lives in Ann Arbor, Michigan, claims that most of the interference to appliances, televisions, and phones can't be blamed on hams going about their normal activity. "The vast majority of these appliances is insufficiently shielded against external fields. The slightest interference- even from a garage door opener or a cell phone-can disrupt it. In most cases, it's not the ham's fault." He said that on the contrary, hams are usually the ones who must suffer with interference from these electronic devices. "Most of the stuff coming out of China spews interference to radios, but the hams have just learned to live with it. Homeowners are totally oblivious to this," he said.

Xiang Qang, the principal investigator at Stanford who co-published the original paper, explained that the radio waves, over the long term, polarize cells in the brain tissue and bias a child toward rough or anti-social behavior. "We saw these children who couldn't sit still, couldn't listen to a book being read to them, and who had severe reading delays and disabilities. We started to see that each time a television was turned on near them, they would actually exhibit worse behavior. So we followed that path: why the television? Why the television? Then we discovered that is wasn't the television, but the radiation from it. So we tested many other types of transmitters and found that the worst ones were ham transmitters from Icom and Yaesu, with the Kenwoods being marginally better."

Qang explains that it is the brain's frontal lobe which is most vulnerable to external radiation due to its location at the front of the cranium just behind the forehead, its proximity to the sphenoid wing- the bone at the temple that houses the pituitary gland- and it's large size. "The frontal lobe absorbs a lot of radiation and since it governs our behavior, this is why we think that attention deficit and hyperactivity are the symptoms of prolonged absorption of high-frequency waves in that region," she said.

"Nonsense," says Dr. V. Subrahaminayalakshminirayana, head of neurology at Kaiser Permanente in San Francisco. "There is absolutely no conclusive evidence in the literature to support an ambitious and imaginative theory that ionizing radiation can deleteriously and negatively affect behavior in children whether the exposure is at a relatively constant low-level or periodic." He believes that attention deficit hyperactivity is more likely a function of exhaustive over-stimulation of the brain by video games, texting, and television viewing. "Ask the Asian parents of your child's playmate why they never seem to have this problem," he laughed.

In fact, the Stanford study found that Hispanic children were fourteen times as likely to suffer the effects of radio waves than were Asian children. Hydra Brock-Parker, dean of sociology at Cal Poly San Luis Obispo and a consultant named in the Stanford study, says that Hispanics live in depressed parts of a city where houses and apartments are packed closer together and the possibility of exposure is much greater. "Where are all of those children going to go to escape radiation from transmitters? There's no backyard to play in and besides, you wouldn't want your children playing outside in those neighborhoods. If you've got, you know, a ham serial-killer type next door flooding your apartment with high-intensity radio waves, you have no choice but to sit there and get sick," she said.

Representatives from Marin, Ventura, and Los Angeles counties were present at the press conference and were said to be keenly interested in the implementation of the new law. A similar measure was introduced into the L.A. County Board's docket on Monday and may be considered at the next session in May.

Christ the Jew=Elite Globalist

Alex Jones is confronted with a mirror false accuser
http://www.youtube.com/watch?v=G_MV0RDBRZU

/ / AJ is not into connecting.

He is making money by spreading fear and
paralyzing people \ \

Alex, my friend, don't lose the cool.

Why do we need to rely on anything
but a fair sounded argument? Look at me: my
word's would suffice in dialog with US, the
Public, if America would demand we speak
openly on Coast to Coast with the facts of
criminality present in tyranny - all with only
needs to drop threats of fists-in-cuffs
against war criminals for public trial. I've
never threatened charm against anyone but
zionist torturers, mercenaries, and those
"Christian" soldiers who kidnapped young
barefooted Iraqi children and hurt them as
the innocent on video tape as sexual deviant
fascist nazis who 'believe' they are lawlessly
un-accountable to God and Man. You have to
be one serious un-arrested SOB before I'll
talk of cage.. well.. there you go. It really
doesn't help OUR cause to be a tough guy
against another wanting open dialog for
Justice. ? right? All for open national
debate in America, raise you voices! Or
don't and fall the consequences of further
ignoring my freedom call for liberation.

King Johnny

The "9/11 Missing Links" trap..
http://www.youtube.com/watch?v=FdmiB4W4YuI

/ / The "Jews" started the 9/11 Truth
Movement....(?) Oh, that's rich! \ \

Look, blaming "Jews" would include innocent
persons, oh like.. Christ. A Zionist though,
states openly the will to TARGET for robbery,
or first degree mass murder, innocent
children, as corporately acceptable being
Satanic enemies of God and man. Remember:

Israeli ACTUALLY targeted Jews in northern
Lebanon with 7,000,000 land-mines. And Condi..
is near the biggest, documented war criminal
of history, and she's a .. .well.. a war
criminal who pre-planned 911 with her "TOP
SECRET" plan to invade afghanistan for Enron.
If she was "Jewish" or otherwise, she'd still
be found a war criminal who pre-planned.. blablah

A MEMORANDUM OF UNDERSTANDING TO KILL MORE
http://desertpeace.wordpress.com/2009/01/20/a-memorandum-of-understanding-to-kill-more-pal
estinians/

/ / Dr. Condi was very smart when she declared

Gaza that it was the Palestinian side which
is held responsible for violating the six
-month truce. \ \

She lies, Innocent Christians die.

-

Geithner's Toxic Debt Plan So Good,
Citi and BofA Can't Wait to Get Started
http://finance.yahoo.com/tech-ticker/article/220758/Geithner%27s-Toxic-Debt-Plan-So-Good-C
iti-and-BofA-Can%27t-Wait-to-Get-Started?tickers=BAC,C,GS,JPM,XLF,FAS,SKF

/ / We're paying enormous amounts to free them
from their toxic assets, and they buy more? \ \

So the 9.9 trillion wagered on this, faith based
quick-fix gamble, contains even more, lose-lose
propositions? (The private banksters do not cover
our loans is the big why of whys here) So why pay
to stay without questioning the cost of this not
winning strategy, as the official goal trumpeted by
even richer Congressmen? OH yeah, so the Private
Banksters can be talentless trillionaires who
buy or sell our favor, with cash bribes on you
going for somewhere, far below wholesale. Leaving
WE, (as God and Humanity), to eek out a lesser
than meager existence to pay them back for every
cent we gave them freely, plus interest of course.

Raise your hands: who's in for continuing this
way without themselves present as accounted for?

Did you know: this latest bailout of AIG, is
the FIFTH given from the public as still not
accounted for either? Once, their idiots, twice,
your the idiot, five times is to be somewhere
past what was once factored as purely theoretical.

(fOo|x)*5 - the irrational expression on how dumb
the public can succumb, before dreaming something
even dumber, is beyond the possible.

Holy man.

King Johnny for open line Coast to Coast
radio Host - Vote early, and vote often!

asks the religious in slanged broken English?

-

UN: Israel broke six-month truce in Gaza
http://atheonews.blogspot.com/2009/03/un-israel-broke-six-month-truce-in-gaza.html

WAR CRIMINALS!

Again, understand, Israeli NAZIS murdered 239
Police Officers who were just trying to defend
our families. The NAZIS also specifically targeted
innocent women and children for mass murder as
Satanic. THEY CONFESSED TO TARGETING CHRISTIAN
CHILDREN - then stated it was pro-zionist Hamas'
fault. Please, allow the godly men and women of
Humanity to speak freely in America, as open
speech dedicated to a freedom currently dying
as enslaved at the hands of the neoconner
corporate whores.

U.S. partner, not Hamas, firing rockets into Israel
http://www.palestinianmothers.com/profiles/blogs/us-partner-not-hamas-firing

/ / The probe found the Islamic Jihad rockets were
actually fired by Fatah. \ \ Whom Israel in response
to the confessed by all to be true facts, murdered
innocent Christian children in Gaza as war criminals.
Actually claimed it was regardless who shot the tin
can rocket that struck no one harmlessly. Again,
Nazi Israeli responded by murdering innocent Christian
children as war criminals with "disproportionate"
force. War criminals who murder Humanity to steal
our shared values.

WHY IS AIG SO IMPORTANT?
http://prorev.com/2009/03/why-is-aig-so-important.html

-

Your buying "TOXIC ASSETS" wake the kucf up
man.

I DEMAND America's greatest enemy, George Noory,
grant yourselves open lines for remedy through
understanding, or don't and listen further for the
demon to openly lie cheat and steal from your life.
The bankers, who are ready to accept another trillion
dollars plus from giving Americans don't cover our
loans - they don't. Before the bailouts started, 99
percent of everybody stated it was dumb to bailout
bankers who's only job is to take our cash for free
as it was. George Noory, the demon who states Laden
did 911, and openly champions murdering innocent Peoples
with war crimes for stolen cash profit doesn't believe he
has a problem with staying happy with America's demise,.
American! You had better speak louder than the Coast to
Coast radio hosts who refuse real Justice to prevail, for
it is now YOUR lives on the line, not just US innocent
Iraqis or Afghans, or the made illiterate nazi teen
grunts of the Air Force who bomb Our Humanity
indiscriminately routinely without apology as the ungodly.

I want Justice, and I want it now for all the victims
of 911. Americans be damned, we want Justice, and We
want it Now.

Barack Obama Pimps the Bailouts on Jay Leno | 2 of 3 | 3-19-2009
http://www.youtube.com/watch?v=huSQCZsq-Ec

'It was all perfectly legal."

No it wasn't. and besides, the private bankers
don't cover our loans. We need to work for
open communications Coast to Coast to remedy
a workable solution through factually based
dialog. Rush Limbaugh need not apply, but he
can if he wills to garner ourselves some
cheating splats streaking repeatedly as cheap
slap stick Johnny style. Rush said yesterday
that stealing trillions from suckered America
is free market capitalism as a prime example.
Again We defeat Limbaugh's COMMI lies in
SECONDS. The entertainment would be
illuminatingly useful while the actual intelligent
men and women of Humanity fairly work our
way though this to a better world. Justice
for all.

Ben Stein on Larry King, said something
near this in reference to bailing out
these trillion dollar frauds: 'it's called
extortion, and somebody out there needs
to insist on understanding that that means,
it's hugely illegal, but Congress has
forgotten you have some dying rights here,
but, they can still call in our forces for
Justice, if America wills it.'

Guess what? We might might be the only
peoples on Earth to realize the
significance of Mr. Stein's factually
based stance on this issue of yours.

http://georgewashington2.blogspot.com/2008/10/ratings-agencies-come-under-fire-but.html

/ / Indeed, emails show that the rating service
employees knew they were acting fraudulently \ \

Did we forget that fraud is not only costly, but
illegal as well? I don't believe so for me,
what say you any Peoples, with an ounce of
integrity to publicly insist on Justice winning?
These trillioniares have negligently managed
to dereviate us into holding empty money bags that
contained our once great wealths. Now, after
stating they "LOST" our money, somehow thereby
that means we 'grant' them to lose Trillions MORE!
into their own private pockets, from the Public
as unaccounted for further, (CNN, CBC,
FoxNews BBC, New York Times, and the rest of
the news professionals SUCK) leaving "us" claiming
we now owe them even bigger than ever. We're not
joking about having a serious communications, hot
button issue going un-addressed for questioning
their/OUR continuing failures. Johnny's Quest to
Host the Coast to Coast Radio Networks is Coming
Soon! Go on the Ready.. Justice We Will!

A.I.G. Sues U.S. for Return of $306 Million in Tax
Payments, Some Involving Tax Deals in Offshore Havens

MP Galloway is banned from Canada
http://news.bbc.co.uk/2/hi/uk_news/politics/7954923.stm

WHO BANNED HIM FOR TRUTH TELLING? Who, as a
serious traitor to Justice as Freedom, would
have the confidence as a demonic liar, to publicly
steal our fair judgement as Canadians on the
willing character of supporting indiscriminate

warfare, killing men women and children as
targeted for heroin pushers, to escape the
neocon enemy liars? Who?

-

Torture Revealed Yet Again
http://www.afterdowningstreet.org/node/40757

How can America continue to remain silent
on these murderous treasons of God and Man?
I don't think we can.

-

Cheney: Don't blame Bush team for economic woes

NWOer Jones: Don't blame Bush the decider

blame the CFR, IMF, Builderburg, Trilaterals,
the Masons, gays, liberals, socialists, wiser
women, wiser men, all without evidence to form
an actual warrant for arrest to defend ourselves?

How can Alex state Bush ain't worth American accountability
because Obama is oh so much worse? If Bush can do
911 and torture without Alex getting his panties in a bunch,
how is it that Obama can enrage him for dare increasing
the non-existent tax on those who "earn" 250,000 or
more in the lawless 'free market', as a stupid evil
ignorant dweeb of a man fearful that America will awaken
without his restrictions on our measurements? A Patriot?.
Can you believe Norris states a problem with a capital
gains tax? Do you People have any idea on how truly
wicked evil that is? ANY? Hedgers have cleared as
much as a trillion dollars personally screwing with
our businesses by nickel and dooming everything, and
with BUSH, have paid zero income taxes on such insane
cash withdrawals. While you as an American worker, who
actually works for a living, have paid your 'necessary'
taxes, and will continue to be forced to comply
further laboring, all to pay for the likes of Presidente
Chuck Norris, and his deeply proud ignorances on Economics,
Justice, Maths, and Religion. Like fellow multi
(b?)millionaire Ron Paul, who claims no call for Constitutional
protections available for demanding the arrest of Bush
and Cheney for high treasons, including the documented
actions of mass murder in America on 911. Never mind the
millions of INNOCENT bombing victims by the bushite nazi
savages of the amerikan air forces Ron states died as
an American police action. HEY! Bush wasn't even elected
and Norris with Alex Jones cares what for defending
American Liberty? Alex WILL continue to sell America out

with George Noory for more money. How much money does
America need pay Alex before he will allow the knowledge
of Bush closing police investigations on 911? How many
to die at the hands of censor Alex, who claims George Noory
is anything but the demon enemy he boasts daily with
his continuing lies to con the teen grunts further for
deaths? How much to allow Americans know the Iraq war has
no cause to still die America for we ask??????????????????

/ / Obama: US Can Detain Americans Indefinitely
Without Charge \ \

Err.. no we can't, for that would be criminal.

Bonus & Retention Payments for AIG Crooks

/ / has been paid out to trading partners such as
banks and municipalities in the U.S. and abroad."

Think about that: billions in US taxpayer money
was transferred to foreign banks! No one even
asks how shipping cash outside of the country
will help the US credit market or the economy.
And isn't that what the bail out was all about? \ \

Wow. We are too dumb to continue without shame
for our failures to demand some inter-national
accountability. How to? George Noory doesn't have the
right to play us further for death in tyranny, with
his continuing refusal to allow US speak
freely on the evidence that directly implicates
Bush and Cheney for high treasons. For bankers
that do not cover our loans. (So why pay them for
nothing but a blind hope they'll lend some back at
high interest?) Water? Food? "Who agrees on sodium
fluoride in our drinking water - let's talk"?
I WOULD ask as the NEW! Coast to Coast Radio Host.

/ / Goldman Sachs, which paid out a company record
$11B in pay and bonuses after grabbing $10B
from taxpayers. \ \

THIS IS FOR REAL.

Bush Whores of Evil are Enemies of American Freedom

http://firedoglake.com/2009/03/13/its-glenn-becks-we-surround-them-friday/

/ / 'No one is above the law, except the Bush
administration. Oh, and dissent is patriotic --
unless I disagree with you. \ \

Yet, near next breath, or the one before, he'll
tell you what all Liberals think. Or all socialists,
or... blahblah Someone should ask him what Christians
think about letting the mass murdering LIAR Bush escape
Public trial for high treason by conning teen grunts who
are now dead. The bushite 'mind control' slaves work
to divide our innocent masses, to have US falsely
believe we are not united by common cause. Justice.
The reason the NWOer, elite mouth pieces don't like US
speaking freely, isn't because they could disagree
with US in public, it's that they don't want America
to learn what a real man is that defends his family.

Chuck Norris ï¿½Ron Paul was Rightï¿½

On pot okay, but on what else? 911? the Iraq war crimes
of liar Bush? Banking? Social Security? Health Care?
Freedom? Trade? Rights? The Republic? We don't think so,
and Norris ain't talking honorably to defend our rights,
because we know, he's a total sell out dysfunctional
illiterate loser to the military complex beyond his
reconin'. He'll kill any American teen with an
un-constitutional con to make the ungodly lawless
zionist enemy traitors richer as unholy thieves, just
as long as we don't make him out to be the COWARD he
is, still warring for the French to oppress The innocent
Peoples of Vietnam. I mean really, where is his
apology on targeting millions of innocent women
and children for mass murder as a Satanic LIAR? WHERE?

Headzup: Glenn Beck's "We Surround Them" Cult
http://www.youtube.com/watch?v=kFFt0S-XApI

/ / Obama wants to improve the health and education
of the American people, HOW AWFUL \ \ Also officially
stopped NAZI Military Commissions, but the bushite

"LAWLESS" enemy, as TRAITORS, continued with more false allegations against the innocent. Death to the bushite torturers of EVIL, death to the enemies of free men who want Justice.

www.911missinglinks.com/

Chuck Norris, The Illiterate Baffoon, 2009:

/ / "Texas has yet to learn submission to any oppression, come from what source it may."

That's actually not true. They drink Dr Pepper here. Dhimmi Peppers, I call 'em. Dang, now I'm on President Chuck's enemies list. \ \

Texas? The State that openly rapes children without arrests? Texas? The State that released a first degree murderer without charge, while executing men not guilty of anything, AS ALLEGED? blahblahblah.

What does Norris know of American freedom?, of liberty? Squat, for he is widely recognized as a dysfunctional illiterate who's made that claim proudly for decades. Again, Alex is 'hiding' his refusal to stand for American freedom with the facts he has apparently completely forgotten of, facts against the Neocon bushite lying nazi traitors of CRIMINALITY. Condi's plan for Afghanistan is the probable cause for the crimes of 911 going un-addressed as officially planned. Bush closed 911 investigations immediately then claimed if we tried to form our own conclusions, we would all be the terrorists for it. (Bush gave zero basis to form his therefore FALSE allegation as the for real evil incarnate Antichrist enemy of Man) Alex doesn't want American families to know this INDISPUTABLE godly truth from the actual Son of Man. For YOU to consider freely for open discussion to win every challenge we will for the defense of real liberty. Alex can't have this for US because, he'll look as weak and dumb as he TRULY is to freedom's actual call, a place where our evidence speaks for itself, as the Public empowered with Justice Willed in All.

(I called NWOer Jason and told him he should learn of the fact that the Bushmob doctored the NIE on Iraq as an act of treason to con teen grunts for death, and he instead of thinking as a free man would, hung up on me calling US all just jealous of his success! over the needless deaths of American soldiers!! - 'besides Bush is just a puppet'. A victim of Alex's very real 'mind

control' to not be a free minded Patriot, but blindly
a whore for the escape of the Neocon traitors of Satan.
Reminder: I along with several other real patriots had
this case sewn up Dec 2001 - a time where Jason was
rooted lawlessly for killing innocent Afghans. However,
at least he's almost trying.. THINK: The loosechange
crews have never, that I know of, never been even
invited on Coast to Coast for a fast ten minutes to be
quickly discarded as the most popular truthers on the
face of this planet. Alex Jones has no problem with that,
in FACT, he'll as he alway has, spew endless praise for
the demon continuing as he always has a godless traitor.
Truthers! don't let this go to your head, for it can make
you no greater, with risks that you will cull yourself
further away as Alex has, (or Venom) that you know better
than everybody else on all things, for, YOUR A BIGOT, and
the billions of People here are all "Liberals" fighting
to be treated fairly, or "Socialists" who know traffic
lights prevent congestion, and save Peoples lives.)

Mike Rivero, from GCN stated that there were only two kinds
of people in the world: anarchists and freedom believers,
and those that want control... blahblahblah. SEE? He
knows near nothing of Freedom. Justice Mike, where order
is made collectively that thee shall not murder another
innocent other for example. Too difficult to comprehend?
I pick on him only because I've explained this to him
already, personally, very simply. He claimed agreement
at that time, but the knowledge has escaped him somehow,
what with Alex near completely leaving the 911truther
movements in the dark on purposes not yet understood by
the dying American suckers.. Is it that now at GCN openly
will sell Justice=Tyranny, for "Liberals"=are-what-you
-demon-lying-nazi-fuks? Anything to divide our wills
to escape Bush and the Neocons for the mass murder of
Americans in New York City on 911 eh?

Alex Jones would rather have every America sacrificed
as conned by his belligerence for the truly wise like
myself, than learn like every American school boy
should: a person accused of a criminal offense without
any evidence to surmise our conclusion is INNOCENT dumfuk.
Laden is innocent of setting the Thermate in the towers,
and George Noory the cheat, our enemy, the censor, is a
demon lying traitor, who on purpose, tries to mislead
EVERY listener with his betrayal to the cause of any
soldier who has ever served for a cause worth mentioning.
As dying for. So many people have been murdered and the
demon can only express his happiness for our continuing
downfalls left undefended by freedom practiced. Look out!
here comes Bigfoot for the 52,000th time. Who is it this

"American" who claims George Noory the traitor is anything
else but? SEE? I want open dialog, Alex, the repug coward,
the bigot, wants the tyranny of censorship to escape Bush
and the Neocons for the provable crimes of 911 in New York
City where thousands of Americans were murdered. MURDERED.
Bush closed investigations. WHAT IS IT THAT YOU CAN'T
FIGURE HERE? Demand open communications above the NWOer
shills of GCN rolling in millions donated by the dying,
who bark against REAL Patriots, 'Bush and Cheney are just
puppets' for directly being criminally complicit for mass
murder in MY America. Who am I to speak such truths? The
one and only, King Johnny.

Canadian Activists and Lawyers United for Justice:

Canada must bar or prosecute Bush for torture,
and mass murder. For he is a war criminal who
lied that Saddam wouldn't let our inspectors in.
And, with Cheney, closed 911 FBI investigations
before we were finished nabbing the actual
suspects for mass murder - that's a no-no where
we're from. See? I'm a strict Constitutionalist.

Canada must bar or prosecute Bush for torture
http://www.ffwdweekly.com/article/news-views/news/canada-should-bar-or-prosecute-bush-lawy
er-3378/

/ / The law says foreign nationals who have committed
war crimes or crimes against humanity, including
torture, are ï¿½inadmissibleï¿½ to Canada. \ \

We are being spoon-fed stupid again...
http://www.atlargely.com/2009/03/we-are-being-spoonfed-stupid-again.html

/ / Moreover, defying President Obama's ruling
putting a halt on all Gitmo military commissions,
the judge on the case not only accepted this filing,
but also released it to the public. \ \

Cofer Black admits to torturing KSM for years,
to get him to confess to near 50 terror events
spanning 20 plus years, TERRORIST CRIMES, that
Cofer has highlighted for US as still incomplete.
Wonder why? No, I mean I'm wondering.. anyway,
torture is illegal and warrants the death
sentence under Reagan's "War Crimes Act", while
Blackwater mercenaries are first degree mass
murderers who will not escape the Justice of
the American Patriot Freedom Fighters. Down
with lawlessness. 'Lawless' mercenaries will not
be tolerated in a free to be world of respect
for our fellow men. Praise God.

Obama Doesn't Have The Right - Just Like Bush Didn't Either
http://groups.google.com/group/alt.politics.bush/tree/browse_frm/thread/52a9c36cff56f27f

-

March 12 - 2009
Alex Jones "Liberals think Obama is God."

A younger, wiser
Alex Jones 'we gotta get beyond the left wing
right wing dichotomy'

Again, he constantly works to DIVIDE the
innocent masses, to escape the Neocon
bushmobsters for mass murder on 911.

CNN says Ron Paul charged with earmarking for his district
http://www.youtube.com/watch?v=bbca34MS8LI&feature=related

Read the comments, and then know: Libertarians
have like near zero understanding of their own
mindlessness evil doings. How difficult is it
to spend ten minutes reading what an earmark/rider
is? It is a criminal theft is what it is. Ron
states the system is corrupt, so he's just doing
what corrupted politicians do. Thousands of
earmarks totaling billions and billions will go
completely unaccounted for, that you as a Libertarian
sucker NWOer pays for blindly. Nobody in America
is allowed to know where the money is going, unless,
you PERSONALLY go down to some hidden office in D.C.,
without recording equipment blahblahblah..
CNN has lightly covered this issue a year or
two ago. But see? Libertarians can't be bothered
to read.. Listen to "Free Talk Live" for ten
minutes, then know, they really couldn't care for
defending YOUR dying rights. Example:
NO BULLSHIT - FTL hosts last week stated that
slave laborers who manufacture to compete for
American dollars, who don't like their living
conditions, (in perhaps a military dictatorship),
can just simply quit, and move to America. Why so
dumb? Because as idiot slave ant ideologues, they
spew blindly being hypno muggers, 'governing is bad',
(traffic light techs, and murderer arresters included!?!
The truth is they actually HATE wise men, that are
greater in every way that their pathetic sell out
of Freedom and Liberty for stolen gains - they have
no true talents!)

The scariest thing about it, is that nobody even
cares enough at GCN to phone in and call them
qwackers! No, like OPENLY fascist ENEMY George

Noory, near an endless stream on how bright to
fellow anarchists they pronounce to be, as being,
corporate nazi whores, whores silent to war crime
offenses committed in America's stolen name.

FBI Believed that Bombs Used on 9/11
http://georgewashington2.blogspot.com/2009/02/fbi-believed-that-911-involved-bombs.html

/ / Indeed, the FBI told a reporter for
USA Today that FBI agents believed there
were bombs in the Twin Towers. \ \

Awesome. Where is CNN and CBC here? Is
this an issue of life and death or no?
Who are they to judge OUR lives unworthy
of defense? I am King Johnny. Support my
demands for open communications above the
NWO shills who bark Bush and the Neocons
must be allowed to escape our Public
authority.

A caller asked Alex what's up with
his non-existent call for Justice,
and Alex responded that Ron Paul NOW
supports the arrest of Bernake. Boy,
we'll all have to look out for that,
considering Ron thinks teen grunts are
dying in Iraq as a police action, not
to rob and kill America for war crimes,
escaping the Neocon. AND, Ron of course
does not support arresting Bush for
treason as a liar that Saddam wouldn't
let the inspectors in.. Ooops, that's
forbidden the mind control 'experts'
of the NWOers.

Michael-Hudson.com - A REAL Economist
http://www.youtube.com/results?search_type=videos&search_query=%22Michael+Hudson%22&search

kucinich.us - A REAL Politician
http://video.google.com/videosearch?q=kucinich&um=1&ie=UTF-8&sa=X&oi=video_result_group&ct
=title&st=day#

Look, anyone in government who doesn't support
Kucinich's bill where the FR has to be accountable
to the American Public, is a treasonous scoundrel
who wants to sell out American interests for more
Criminal sacrifices. THINK: they took the bailout
money for THEMSELVES!

SuperNews! - A Night with Ann Coulter
http://www.youtube.com/watch?v=KmLJDrsaJmk&feature=related

Ann is like these NWOers some what eh?
Anything to escape Bush and the Neocons for
the mass murder of Americans. Ann actually sounds
near identical to Alex's excuses for attacking
Liberals, Socialists, gays, do gooders, anybody
he'll demonize to divide our voices for Justice
against the guilty parties of 911. (he's even
recently said some derogatory words against
the equality of Women's rights if you can believe
it!) Condi however, he has near never even
metioned but for to quickly pass! The 911 witch
who ordered not only the killing of Americans
for the criminal Neocon plan of plunder through
the mindless grunts of the military, who
lied daily about Iraq's wmds, but also, was
the sole person responsible for ordering seven
million land mines to be dropped on Jews in
Lebanon. 1441. When has Alex in his entire carreer
expressed interest in defending Palestinians
from indiscriminate slaughter supported by
Repuggers and Dems alike as Proxies for Satanic
godless war crimer Israeli? Is it because it
isn't popular to defend an innocent other in
Guns for brains Texas where rapists walk free
and innocent men are put to death without a
whisper of concern from the Chuck Norris' of
that world? Alex actually stated that the sound
of the bullets going into the backs of those
two innocent Americans was 'the sound of
Liberty'. Or, in other words, has Alex
supported arresting all AIPAC members as
accsessories to mass murder and blatant
treasons against the good old red white and
blue? Of course not, but demands he is US
fairly.. how so bro?

Mossad linked to 9/11 attacks: Report
http://www.presstv.com/Detail.aspx?id=87982&sectionid=3510203

Justice we will.

Four largest TARP recipients spent billions
http://rawstory.com/news/2008/New_memo_details_questionable_transactions_of_0309.html

/ / The Goldman Sachs Group, which received $10
billion in TARP funds at the end of October, saw
fit to spend $2 billion earlier in the year on the
repurchase of company stock, which resulted in
an increase in company share price. \ \

Now, are YOU still going to refuse to demand the
Coast to Coast radio network stop working to
kill Americans for evil stupidity through the tyranny of

censorship, and instead, allow open communications
where John can host for dialog? Again, GCNLive will,
as largely bigots, will mimic daily what ALL "liberals",
or "Socialists", 'think' as fascist Commies - blindly
being derogatory to divide our innocent masses, OUR
WILLS, to start arrests with the traitors Bush and
Cheney - for PROVABLE crimes such as MASS MURDER on
911 by simply closing outstanding investigations.
The NWOers are the 'unstoppable' NWO, who they claim,
we can not bring formal warrants against ourselves.
The Iraq war is a needless war crime of dead
people that has no need to be, (why bomb
where you can go anywhere without delay)
a crime that all GCN hosts currently will forbid
communicating such knowledge to defend the
lives of sacrificing teen grunts. Why does not
America demand Coast to Coast allow the evidence
of 911 being ACTUALLY orchestrated from Condi's
office with her pre-invasion of Afghanistan plan for
Enron, (as so reported by MSNBC.) be openly aired
for grievance? Who's freedom does the NWOers defend
by blaming without needs for forming probable cause?
People who blame other INNOCENT people with labels
concocted from the broken minds of bigots? Again,
the bartender from the "CFR", isn't guilty like Condi
from the "CFR".

Wake up people, we are under attack by those
who refuse US Justice to win Freedom for anyone.

Fed to Taxpayers: Up Yours! -- Insists on Hiding Bailout Data
http://wakeupfromyourslumber.blogspot.com/2009/03/fed-to-taxpayers-up-yours-insists-on.htm
l

Who cares in America? All the bushwhores like
Alex Jones love George Noory for forbidding open
communications in America, while championing wars

against US as innocent folks all to further escape the TRAITOR neocon LIAR war mongers for the crimes of mass murder on 911. George Noory HATES America to have Justice where a man like me could explain the errors of a bushite's lawless ways in seconds, and America can not be granted such wisdom to be freely expressed where the good guys win. Sadist Ron Paul wants to gut social programs blindly as a corporate fascist, while claiming 911 was committed by bin Laden - and, shockingly, (when you consider the evidence available) that the Iraq war crimes of rape, torture and mass murder, are actually an American police action to defend God's world - and Alex has ZERO problems with those demon lies, and won't let ANYONE express the facts on such History. To think that Alex insists he and Ron Paul leads our "freedom" movement! Alex wants to gun down innocent men in America as boasted, and RON WANTS TO GO A GOLD STANDARD, BUT DOESN"T WANT TO RECOVER THE STOLEN TRILLIONS. Who can afford this continuing deliberate ignorance of Alex Jones and the bushwhores, still asking for our dwindling money to fight for anything but Justice? Who? How much will it cost America to donate to Alex Jones to afford US the public knowledge that the Iraq war is a war crime? Or that we have video of iron flowing like water from the towers? How much?

Bushwhoring Enemies of the American Police

What a demon enemy of life these bushwhore enemies of American Liberty are eh? No concern whatsoever, for all the teen soldiers conned to die for those who committed 911 in NYC. The millions of bombing victims, the tortures, the rapes of American women, STILL, TO THIS DAY, left undefended by "the law". Evil enemy of everyone these demon fuks are. How difficult is it, to understand the facts they feign complete blindness on? They WANT to con you as the coward to life they are, willing to kill America to make their antiChrist lawless enemy Mr. Bush happy.

INTERPOL REJECTS CALL FOR ARRESTS OF WAR CRIMINALS

/ / INTERPOLï¿½s Constitution strictly prohibits the
Organization from making ï¿½any intervention or
activities of a political, military, religious or
racial characterï¿½. \ \

Then, what the fcuk are they good for to not speak
against clear war crime injustices against God and
Humanity? Who pays for this without thought to
question? YOU DO.

Alex Jones is a Bushwhore

Alex Jones stated today the reason why Ron
Paul constantly LIES to America, is because
he needs to play politics. Yes, he like Alex the
censor of Truth, does not have the intellectual
skills to ACTUALLY defend his silence of a
grunts lawless position. 1441. American grunts
in Iraq are dying for the escape of the Neocons,
as NOT police officers trying to "police the
world". Understand: Ron Paul actually sells bin
Laden is the target for the crimes of 911. And
Alex Jones, who we know knows better, refuses to
defend Freedom's cause for Justice. No, today he
told US he sides for a Con because he doesn't
want America to openly communicate the facts
to save our souls. Again, a bushwhore who
believes Mr. Bush is above all the laws of
the Universe as the Conservative bigot's false
deity. Again, Mr. Bush closed 911 investigations
as godless traitor. We, as Humanity, demand the

demon enemy of Life, George Norry grant US the
freedom to speak freely on the evidence available
directly implicating the bushmobster Neoconners.

A Jew Speaks Out! - "All the answers are here."
http://www.webfilehost.com/?mode=viewupload&id=415673

'Israeli Military Attacks the Civilian Police Force'

Zionist Nazis CHOSEN for Public war crimes trials.
War crimes warranting death by Jewish firing squads.
Only Black Jews will be asked to pull the triggers
on the war criminals Convicted of mass murder. The
Zionist NAZIS confess to have broken the truce, to have
then targeted Christian School girls for deliberate
satanic mass murder against God ourselves, the Innocent.
Trying to have ourselves blame all Jews, instead of
the demonic zionist threat against Humanity. These be
not Jews who steal anothers home, but of that which
The LORD preaches. The Bible "I know the blasphemy of
them which say they are Jews, and are not, but are the
synagogue of Satan."

REVEALED: 'There was no Cabinet debate in run-up to war,'
http://www.dailymail.co.uk/news/article-1158148/REVEALED-There-Cabinet-debate-run-war-says
-Short-Government-refuses-release-minutes.html

/ / The Government is refusing to release minutes
of Cabinet meetings before the Iraq War because
they would reveal there was no discussion on
the issue. \ \ Couldn't even be bothered with
pretending when the cameras were off? Lazy
nazi war criminals laughing at Humanity's
demise for sacrificing to the ungodly Zionist
LIAR gains of demonic origins..

911 WTC7 CBS Breakthrough
http://www.youtube.com/watch?v=vEn_6vqp17Y

Amazing News on Fox - 9/11 was an inside job told to troops
http://www.youtube.com/watch?v=Fbgd-mBdSjQ

9/11: Impossible Speed & Impact -- Busted! Updated
http://www.youtube.com/watch?v=L978nIT-AY4&feature=related

The no planes idea is mostly ignoring
the fact, that we all agree explosives
took those towers down as widely captured.
It's an inside job. The questions are always

cool, (though sometimes wasting time) and
by challenging our conceptions on what it is
that we can prove is vital if we're ever
going to understand that by Bush simply
closing criminal investigations on 911, he's
"officially" assisting in the escape of
those truly responsible for mass murder in
New York City. Why? Well it seems the Neocons
had this planned all along with those in NATO,
and the Chiefs of Staff, to con the dumb grunts
for criminal greeds. You know, a repuglicon.

Johnny for Coast to Coast Radio Host!

-

Wizards of Money
http://www.takeoverworld.info/wizardsom.html

This stuff is excellent! They are playing
the odds exactly like the bookies do. It
is actually illegal to do that now when I
think of it.. ! We'll need to discuss this
internationally to gain a better focus.

Your Car Has Been Repo'ed

The derivatives recordings sound fascinating.
I know the banksters don't cover our loans, fraud
from the get go, but these available estimates
going as high as into the tens of quadrillions
are a mathematical impossibility. But for the
the 'value' of something speculated with
OUR assets as truly worthless to be an "investment
vehicle" for our futures. (Like Hedge Funders.) The
"toxic assets" are the crime scene evidence of
monster fraud, where for the sales of paper
arbitrarily determined to be worth zillions,
they took the real deposits as commissions in
the trillions, just like a bookie does but
usually far more fairer. At least that is how
I see it with my limited knowledge on this one
particular scam of the Capitalist Free Market
System of Lawless Corruption Due a Failure in
Real Leadership. - worthless pieces of paper
America has paid trillions already as dahh..
LuCkY WinNaaAhhs. Do you People even know what
a Hedge Fund is? They hedge US out of the Markets
by nickel and dooming everything to undermine the
Market in it's entirety. And, some of these
people have "earned" as much as a trillion
dollars personally in the span of a short few

years under repuglicon misrule. Geniuses? Hardly.
What every Bookie does as a felony warranting
unjustly Life probably. They trade bets,
and take their cuts, paying themselves with the
money the private Investment banks hold, leaving
derivatives as balanced collateral, BUT, a
derivative can have no actual value. It can be
just the rules on how the cash will be divvied on
this next go-around with the suckered. As according
too, to a 60 Minutes spot on this very specific
issue. Now, the bushmob with Obama, CNN, FoxNews
and some of MSNBC have been issuing the blind
acceptance, that buying these "toxic assets" was
a better investment, than publicly challenging
ourselves on where all the actual money went? and
for wHaT?? Manufacturing has been purposefully
outsourced by the Bushmob as treasonous SABOTAGE,
while now, to make up for a small percentage of
the massive job losses, they, to FOOL YOU, include
those who flip burgers as the new Manufacturing Jobs
created to make the numBerts look not so bad - but
for Christ's sake, who even cares enough to demand
CNN to count our Lives as worthy an Ernie or Bert?
..besides, the Private Investment Fraudsters told
US already. Bonuses paid by Public Welfare in
the trillions to actual billionaires, with one CEO
bragging all he needed to do was fudge his books,
and he then immediately qualified himself for 272
million! IS FOR REAL. It was in the Washington
Post. No, nobody was arrested, yet, in fact, I
wouldn't doubt he's going to try for a second
Public Cash infusion to bolster his 'credit' that
you can't/don't/won't know: the magical Banksters
never even cover our loans YOU left for robbed
dead victims - So, needless to say, these new
Inter-National Trillioniares, that expect Ourselves
to pay them back for minimum fifty summed generations,
have been going on one hell of a shindig binge
of excessive excesses, but what about the continuing
"CRISIS" of PUBLIC Banking left undefended by
looting? Giving the banksters any public money is
totally crazy when we think aloud, but more?? is a
recognized crime in progress. Giving public money
to banksters to do what THEY will with our
investment is nuts okay? - even if they lent it
back, of which they have formally refused, but even
if they did, it would still be nuts because where
is the public's interest being defended where they
pocket privately by defrauding near all at 99
percent there also? It's like you EARNING a thousand

dollars, to then be told by the banker, he's
going to charge you a thousand dollars plus interest
for cashing YOUR check at the only bank available
for fifty miles. (Your car has been repo'ed.) Answers:
The depositor should be recognized as the shareholder
- and there should be no private interests existing
to take in between our exchanges for goods and
services. Banks need to be separate from the Casino
frauds which comprise much of what the Market is
today., and a tax for every buy and sell needs to
be re-introduced. Obama, and the Repugs want US to
religiously accept the broke Banker Buildings rule
our Reality by giving of ourselves blindly in huge
error. We can work it out. Ego must be chucked
- facts are facts - and Justice is measured as
Freedom is cherished. In other words: No evidence?
Person innocent. I rulez.

Trillionaires, whatyahfingureeh?

Johnny America for Coast to Coast Radio Host.

Children sodomized at Abu Ghraib, on tape
http://www.salon.com/politics/war_room/2004/07/15/hersh/index.html

Again, understand: these "American" soldiers
are still being recognized as heroes. American
"Heroes" in the Mansions of Florida going un-arrested
for raping, and/or torturing INNOCENT PEOPLE TO DEATH.
Erstwhile committed criminally, to assist in the
'escape' of the neocon traitors for the crimes of
massive banker fraud, 911 and Iraq. Bush personally
worked to close FBI 911 investigations, immediately
after the terror attack occurred. Criminal. Torture is
still illegal if you didn't know so as an American
victim silenced by Coast to Coast censorship on your
personal value system being sacrificed. Pick up a
phone to champion wide open communications - Justice
for All is Freedom won. Speak for US demanding
international 911 arrests of those directly
responsible for mass murder in New York City.
Starting with Bush and Cheney for obstruction,
and any other that would stand against the
True American Patriot. Justice for 911.

Yours Truly

Autism & Vaccines: U.S. Court of Claims
http://www.nvic.org//vaccines-and-diseases/Autism/courtclaims.aspx

The PROVEN fact here is that, without DOUBT,
Mercury causes brain damage one hundred percent
of the time. NO DEBATE. But Alex's NWO will blame
anyone but themselves for this communications
failure. NOT DEMANDING arrests against those in
government LIKE BUSH, who have consciously allowed
this massive criminal assault against all children,
continuing against our better judgments. Realize:
Alex Jones actually believes George Noory is anything
but a willing traitor who boosts in tale, propaganda
lies of death through terror to sacrifice American
GI Teens, all for the escape of the 911 perpetrators.
So again, I ask all to question, what is Alex's point
in not mentioning the crimes of the Bush Administration?
The Courts are being told to rule on whether a proven
connection can be found from vaccines to Autism, where
OUR Court should instead be ruling, mercury is a neural
toxic heavy metal causing irreparable brain damage.

Bobby Jindal Gives A Pathetic Speech
http://www.mefeedia.com/entry/bobby-jindal-gives-a-pathetic-speech/14744063

He looks at US all, like naive five years olds no?
Unless he actually talks like that all the time,
then we maybe should be asking, who actually here
voted for this guy 'publicly' by under estimating
on our present economic dilemma, including
absent Justice for You also? Repuglicons on
TV should learn about themselves firstly,, instead
of denying our wiser, stronger voices. Instead of as
lackey substitutions, who jack for the murder of innocent
others portrayed 'suckered', you lost to blindly whoring
for the war criminals in Israel. The 'lawless' Bush
administration DOCTORED the NIE on Iraq, while Bush
LIED repeatedly that, "Saddam wouldn't let the inspectors
in." Assisting in the escaping the TRAITORS responsible

for the crimes of 911. Bush closed FBI investigations.

/ / btw jindal was horrible...came across so
phony...but if that's how he really is...yikes! \ \

US repeating old Iran lies at UN
http://www.presstv.ir/detail.aspx?id=86904&sectionid=351020101

THIS IS FOR SURE TREASON NO?

-

Alex Jones is a Fraud

/ / A bank that received $1.6 billion in bailout
money just spent a fortune last week in L.A. hosting
a series of lavish parties and concerts with famous
singers ... \ \ While CNN with George Noory can be
only happy here watching America robbed and left for
more dying victims? Yup. Who cares? Alex doesn't for,
George Noory is a 'good guy', and what ever you do,
never encourage the truthers to organize for public
debate against the evil enemy forces of the Satanic
LIAR Coast to Coast radio programmingers. Why, because
Alex Jones THE LIAR, would lose, and Americans would win.
Again, never forget, it IS Alex and George who silence
those who truly speak for Justice in America. "Bush is a
puppet" is the call of a hypno mugger, who cowardly,
refuses to fight against those who PROVABLY commit lawless
acts of murder in America. Not a Jewish conspiracy, you
demon fuks who deny George Walker Bush. Alex Jones stated
today as a demon enemy of GOD, that the bible states
the AntiChrist will appear posing not as Bush. I again,
demand Alex PROVE his NWO FRAUD against the Son of Man.
I want free communications to face any or all who
disagree that the Bushite promotes lawlessness as
acceptable, while Alex wants to lie as a cheat to
only pretend his rights champion ours dying. No evidence
against the accused, is US being abused.

the banker does NOT cover our loans

/ / Alex Jones on Coast to Coast tonight to speak Bush the mass
murderer, is just a 'puppet' for lying that Saddam wouldn't let
the inspectors in WITHOUT CORRECTION \ \

He's a bushwhore. A soul who refuses others to actually
understand their own conclusions. It's all about Alex, and
not about Justice. Bush closed 911 investigations. He'll
go on and on about the new bank of banks their selling
against "all" as a diversion to understand, the
international private bankers have stolen trillions as
of late, and believe Alex and George ain't gonna let

Americans know: The banker does NOT cover our loans, and
even if they did, WHICH THEY DON"T, why give them our
own money to only hope that they will lend a small
back to ourselves at high interest? The derivatives are
crucial in understanding what is going on here, and Alex
is stuck in his bullshit, nwo crap, blinding him from
understanding how the scams went down. A derivative has
no real value, unlike ARGUABLY, everything else comprised
of 'free market' highjinx. It's like me selling you a
piece of paper with nothing special written on it, for
ten billion dollars. NOW; why would you do that? Because
the American suckers are on the hook for the loses because
Alex doesn't want smart people to speak. Steve Quail is
as real a demon enemy of God and man than anyone. "He talks
directly to God", and 'knows' consciousness can be
imprisoned into Military Intel. Comps., but doesn't know
Laden as falsely accused - delusional enemy of rational
thought denying, like Alex Jones, Justice and Truth.

Justice in The Gun State of Texas

Texas Prepares to Execute Man for Driving a Car Near Scene of Murder
http://maritimes.indymedia.org/news/2007/08/21460.php

What's The Point Alex?

Hey! Alex Jones said today Bush isn't guilty of nothing,
but boy, Obama is bad he'll tell you never mentioning
the FACT Bush LIED US into the Iraq war as a war crime. 1441.
Won't allow it. Why? He is a bushwhore, a believer in Bush,
the Antichrist enemy of Humanity who told US if we tried to
form our own conclusion, we would all be terrorists. NO JOKE.
Bush, the most evil man of all History, Alex claims is
guilty of nothing. Example: Bush, is his first days,
STOLE 50 billion dollars. How can Bush (the banker family
tied to Hitler) be above all the laws of the Universe
someone ask Alex. You know, Alex will hang up on any man
or woman who states in question, as he did with Peggy,
a once loyal listener, why he refuses to acknowledge the
evidence of Ron Paul being cheated through a fixed
election. Attempting as a demon, to demonize whomever
phones with such truths - like Ahmad, or Condi's 911 plan
for Enron. Alex Jones is openly a bigot, and a man who
has OPENLY confessed the willingness to murder INNOCENT
Americans - before allowing Justice to rule for the
defense of every American. I want open debate, he wants
censorship, so he can continue to masturbate to the
continuing deaths of innocent Americans. Laughing with
DEMON George Noory who claims Laden did 911, Hamas broke
the truce, and Iran is a holocaust denier. Enron. Has
Alex even ever mentioned it as motive for invasion of
Afghanistan? Never. Has Alex ever stated the Taliban

were simply asking for evidence to form anyone's
conclusion on who was PERSONALLY responsible for 911?
NEVER. THINK here. Even after me sending him email
after email for years. Alex states all who criticize him,
are delusional, because he warns people of poisons fed
the masses. So therefore, every last word I state about
Alex Jones undermining our wanting for real Justice is
correct without argument - As according to ALEX, he is
delusional. Wow eh? Alex is a stupid bigot as a matter
of fact. He'll tell you we gotta get past the left right
thing, (trying to steal my thunder - where i give to all
freely) yet, near next breath, or the one before, he'll
tell you what all Liberals think. Or all socialists,
or... blahblah Someone should ask him what Christians
think about letting the mass murdering LIAR Bush escape
Public trial for high treason by conning teen grunts who
are now dead. Bush PERSONALLY closed 911 investigations
immediately after all. Again, NEVER mentioned by Alex
as important to our struggle to arrest, try, and execute
those responsible for mass murder in Johnny's America.
An America were every Human life is worthy our protections.
Where Alex Jones is NO GREATER than anyone of US. He is in
a popularity contest, while I couldn't give a rats ass
what rupuglicon, or demoncrates think about my wise words
on God and Justice. Great entertainers I am not blindly
enamored with, nor do I believe FALSELY, demon Bush, the
Antichrist, is above and beyond all laws of our Humanity.
If 99.9 percent of godless Americans disagree with me on
God's will to have all neocons with the Bush Administration
arrested immediately for public trial for high treasons,
to hell with them all as they lose their rights rightly.
For, they are not our friends who willingly murder OUR
Humanity for stolen private Banker gains. Alex, a bushwhore,
a censor, wrongly believes Bush is guilty of nothing. A
bushwhore of the antiChrist he is. I mean come on, he
claims all those folks who followed truth mentioned in
the Bible were murdered. How stupid is that????? From
what I recall there was a misunderstanding, and well, that's
about it. How many American "Christians" actually believe a
man of God actually walks this world? How many? Being Gay
is okay with me. I'm not Gay, but still to each his or
her own, as long as your not infringing on the rights of
another to do what ever they choose. I love all children
too much. Real Freedom. GCN advertised HATE for Gay folks,
then at the website, murder - and the station sees still,
no problem with dividing our innocent masses on desperate
attempts to escape the neocons from Justice. That's the REAL
reason Alex states a derision for Liberals. Note: "Liberals"
in Canada are a right wing party that disbanded the RCMP
corporate crime division as perfect example, and! sent a

Soldier to prison for refusing criminal orders. Never allowed by Alex, for his gold dealing boss has a son killing innocent Peoples for Neoconned cash in Iraq today. ALEX WANTS TO CENSOR US ALONG WITH THE ENTIRE BIBLE NOW WHILE MASTURBATING HOW HE IS NEVER WRONG? In his dreams maybe, but not our shared suffering reality. By the way, has Alex ever written for Justice? and why not?, considering he is so greater than all others who haven't been invited on his show he stupidly said two or three days ago, me, and everybody else here globally? Truly delusional he is for not being truthful. Be a man Alex and face me in open debate to defend YOUR idiocy, he won't because HE KNOWS, Americans would win, and we would look the fool as loser. Too cowardly to defend America he is, because he doesn't have the virtue for it, and refuses to hold respect for men like me hugely wiser than himself he works to keep all down for death.

Bush and Cheney are traitors to the cause of American Liberty. To leave them free, is to leave America un-guarded from further transgression.

Patriotic American Navy Vet is tortured by bushite nazi grunts http://killfile.newsvine.com/_news/2006/12/21/491153-white-american-navy-vet-is-illegally-detained-tortured-and-tried-by-us-government?last=1166730840#last_4

Again, Reagan warrants death to all who torture, and a deep hatred for all ungodly in America who support it. Why? Because the vast American public (especially FoxNews treasonous LYING enemies of The People) DO NOT have the intellectual skill to understand what freedom is. Justice. Look at me! they can't seem to talk for Christ's interests, that smart ass know it all, where he thinks he's so ingenious where no one on Earth can find fault with his indisputable simple logic we share EQUALLY. (Bankers don't cover our loans for example) Kill my kids, my spouse, myself, before allowing John to speak openly in the public on Coast to Coast for open debate, all of Americans say in silence censored. Why does America continue to die this way? Because bushites are truly as they claim, stupidly ignorant as treasonous cowards, or as prosecutable criminals, evil people who only want in this world to rob or murder People indiscriminately as enemies to Justice, enemies to GOD, a Criminal. NOT A JEW you fuks! George Noory will tell you freely all about his hatred for our Humanity, he does it near everyday, though People don't have the ears to hear, or the care. Too scummy. That remember! get American GIs murdered by the score with NO REASON AS FOR. Example: why bomb more than a million innocent souls indiscriminately in Iraq, if you have complete unrestricted access to go where ever you will?

And, that Bush, Cheney, Condi and such, knew from day one,
Saddam had all the WMD destroyed as documented fully, as
did I. Documents that BUSH personally stole if you recall
not listening to Alex Jones, Foxnews, CNN, or the CBC.
err. maybe it was Bolton - s-t-o-l-e-n -.
Likely, as a likewise deeply ignorant person, you know
little of Life as principled for individual freedom, and
couldn't care less what this boundless Universe offers
all in reflection, instead, it all about what's in it
for you as a lying cheating thief to this mystery right?
Wanna be a lawless mercenary to murder innocent people
dreaming of becoming a private investment banker, who
never earns a dollar in their entire careers, taking
trillions undefended from Humanity just to see US
suffer to deaths for our continued silence. All you have
to do is raise your phone to demand justice in our times.
All Neocons must be arrested for public trial, along
with near every last member of the Bush Administration.
PUBLIC TRIAL. And Soldiers must learn quick a commander
who doesn't support getting those responsible by following
the crimes scene leads, is a commander deserving of an
immediate firing. Otherwise, what use is the grunt
good for eh?

Again, Ron Paul like near all Libertarians, does not
acknowledge the wanting of Justice for the high crimes
of Banker fraud, Iraq, or 911! He took the "Truther"
money, but refused to support the arrest of Bush for
treasons times 50. Social Security he wants to gut
like Health Care as a sadist who knows near nothing
on how such systems currently operate. Again, he
does not speak of recouping the STOLEN 1000s of
billions from America, or the lives. STOLEN. What
is it that you can't figure here? Fuk ego, FACTS.
We are all effected by suggestion, this is why,
since the dawn of time, evidence has been the
prerequisite to convince ourselves of anything.
Alex's cartoon storyboard, is truly, as measured,
Alex masturbating with our precious times. Think:
Alex doesn't ask Americans why they don't support
the arrest of Bush for high treason because a world
where all are treated equitably is beyond his
understanding as a bigot. He could change, but he
is 'light years ahead of the Public'.. but of what?
All you need do, is every time Alex says "they",
ask yourself, WHO? - then know: the bartender at
"Bilderberg", isn't as FOR SURE guilty of crimes as
Condi from "Builderberg" is. The 911 plan came from
her very desk according to MSNBC, never mentioned by
Alex Jones. Why? You have to be near genius like

me to explain it COMPLETELY without even seeing it.
NOT MAGIC, more like meditation through understanding
our universe is ruled by good ideas. Alex is a man,
a Good man mostly, with some fears countered with
an irrational aggression (not thought through) that
found him blindly supporting the murder of two
innocent men. Not freedom. while I, am of God. An
actual god. The Son of Man as a matter of fact.
I want to tell you how great Life could be, but i
see so very little of words present to survive the
lawless corporate state. I AGAIN, will ask YOU to
forward this post to two People, but will YOU??
Torture is outlawed by warranting Death under Reagan,
and.. it's like the best way to resolve a FoxNews
'excuse' given to illiterate nazi grunts to abuse
ourselves as innocent others. Tell me I'm wrong.
. . KBR rapes American women, or murders them,
and needs to be hunted down by All American military
forces for it, as trialled to death. Including all
commanders of the Air Forces responsible for bombing
our families without causes. And lastly, any that
discourage our grunts from not supporting the arrests
of those that actually did US wrong. Get to it.

DEBATE OVER

/ / Late last week, a federal court ruled that there was no link between childhood vaccines and Autism. But the legal conclusion is not enough to erase many parents' concerns and the debate continues. \ \ Mercury causes brain damage as a neural-toxic heavy metal. Love God why don't you? Alex near always calls his critics jealous, so, are you jealous? Would you rather see every American child murdered, or suffer toxic poisoning, before acknowledging we are without challenge, the greatest minds of our time? Hurt you does it? Can't find a single argument against my demand for Justice, but dying instead, claim my call for freedom practiced is to good is to be true in your dying dummy world censored? It IS George Noory that denies you the respect a person who craves Justice for all 911 victims. Cartoonish Alex Jones, the bigot, sucks.

Alex Jones, "Liberals don't like Bush."for mass murdering Humanity as never elected demon enemy of God he means?

He tries to divide the freedom movement away from Justice for ourselves.

Question for Alex Jones NWOers, wouldn't God, if we existed, wouldn't God, push for a one world government where all are treated fairly through Justice practiced? Yes or no?

America! I am King Johnny.. I am from the Planet Earth, I've come to share the knowledge of Justice in our times on behalf of this, Our Future Great Triumph over Evil.

/ / At 8:51, the flight [175] deviated from its assigned altitude [31,000 feet - therefore cell phones impossible], and a minute later New York air traffic controllers began repeatedly and unsuccessfully trying to contact it."

And one minute later at 8.52, Lee Hanson receives a call from his son Peter. \ \

Couldn't have happened, as is why, these phony "FBI" bushmobsters stole the recordings and don't want the still dying victims to know the truth of the Neocon traitors to God and Justice. Cell phones are not capable of paralaxing above likely a couple thousand. Someone on Earth would likely know the near exact scientifically measured distance as nothing greater than a couple thousand, for why the need to put towers all over our fair cities then? 31,000 feet is a distance of miles! Hint: 5,280 feet in a mile. 5.871212 miles in fact. Drive out 5 miles from your nearest cell phone tower, oh yeah, and don't forget to bring a elevator like aluminum box to stand in, moving 500 miles an hour, then ask yourself, how dumb does a Repuglicon or Obamanaut take US for as silenced to the tyranny of mass murder in my America?

TED SAID SHE DIDN'T HAVE HER PURSE
http://911review.org/Sept11Wiki/Olsen,Ted.shtml

/ / Ted supposedly told CNN that she called him collect. However; once a credit card is swiped, you can begin using the phone to make calls. So, no collect call would have been made. \ \ The allegation also has been debunked by reported to be, Airline officials who stated no public phones were even available on 177. That seems near too far fetched, BUT!, GTE Airphone reports DO SAY - zero call assists were made on flight 177. ZERO. So, how then does she make a collect call then, and why if as claimed, Ted and Barbara were madly in love, would she not know her hubby's personal number?

Remember, Ted was the coke pusher's lawyer in the Contra case, of which Ted, was also assistant secretary to the Solicitor under Reagan. The Contra group if you recall were/are pushing crack cocaine into major cities for plans to undermine the American government for illegal wars against peaceful civilized life as stolen profit. YOURS.

FBI SAYS TED OLSON LIED OR WAS DUPED. NO 9/11 PHONE CALLS
http://www.youtube.com/watch?v=v78ibOa4PDE

The Olson story would make for good horror if it just wasn't so horrific. EVEN I'M SPOOKED. Olson tells of a elaborate drama

where he learns, she without her pursed
cell-phone, has to call through the phone
records of the Justice Department. How did
he forget that fact when first pronouncing
of how she had phoned him from a cell-phone,
or, then from an airliner that didn't have
phones in the cheap seats, nor tear-gassed
upper-classes? The trouble here is that
a small cadre of bushmobsters keep hiding
the evidence on CNN, FoxNews and George Noory
implicating themselves at the crime scene,
as illegitimate "intelligent officers" -
we WANT to know our media voices the voices
of those who support defending ourselves from
the 911 war mongering terrorist enemies.
Evidence is the prerequisite.

King Johnny Speaks Coast to Coast! Answers Everything!
http://www.mediafire.com/?myz0etmzx1y

Beverly Eckert - victim to mysterious plane crash
http://www.commondreams.org/views03/1220-04.htm

It's too bad Alex Jones, and his demon 'buddy',
George Norry forbids Americans to know of General
Ahmad, Bush closing FBI investigations, and iron
flowing from the towers as more important than a
passing fact he might have mentioned three or
four years ago - Alex I mean - George's direct
policy as so told to Alex, is NO INFORMATION on
who was personally responsible for mass murder will
be ever allowed spoken, while he demonizes millions
on hopes for more indiscriminate mass murders killing
mindless teen grunts to profit Zionism's war against
Truth and or God.

Stephen Harper copies John Howard WORD FOR WORD
http://www.youtube.com/watch?v=L8YwJC_nBgw

This is FDR's idea that worked "refinance near zero interest"
So, a working plan could be to create a near no private profit
plan, but a public plan that profit's The People Instead of
Banksters stealing our public authority unchallenged by American
corporate culture for personal private interest left undefended.
The Depositors are the Shareholders! Broadcasting Everywhere.

/ / Provisions to impose a penalty on banks that paid
hefty bonuses and to cap pay at $400,000 for all employees
at firms applying for additional government funds did not
survive the compromise, sources said. \ \ Another sacrifice
to America's "God" substitute. aka magic private banker
zillioniares, who rule the free thought of TV AmerikCo

giving your life without free thought to question.

Why pay bankers more when they DO NOT cover our loans?
Hate US still for speaking truth dying amerikcan dumfuk?

Widespread Suffering and Death
http://www.youtube.com/watch?v=gVdee2iXSVk&feature=related
[CNN pulled this A. Cooper report off youtube - accessory]

Notice no one shoots at the blimp fire bombing the
entire neighborhoods. And if it's phosphorous, that
smoke is already deadly toxic. That is why it warrants
the Death Sentence under International Law when used
against OUR Humanity, as the most evil of Nazi War
Crimes ever.

responsible for releasing millions of American made land mine
cluster duds that will murder as TERRORISTS do,
indiscriminately for decades. Perez, the DEVIL, along with
corporate news zionists, hold those crimes deserve immediate
executions with targeted strikes against the purveyors of true
EVILNESS. Please I beg, give G-D mercy.

http://www.waynemadsenreport.com/

/ / According to U.S. intelligence sources, at the end of
June 2001, the FBI intercepted two phone calls from Grossman
in which he told the called parties to "stay away from
Brewster Jennings . [Plame's TP SCRT Cover to nab REAL
terrorist WMD proliferators by using GOOD policing freedom
skills - with logical arguments, warrants, and everything!] .
. they're the government . . . they're nothing but a
cover." One of the calls was to a Pakistani Inter Services
Intelligence (ISI) top agent in Washington. \ \

So, the ISI was warned by the White House clandestinely, in
June 2001, 'some do gooder cops are on the prowl defending our
interests, looking for REAL terrorists who jeopardize
Freedom's cause, so, you'd better watch out for America's will
power, US might get US, and boy, then we'd be in for one big
hell of a surprise!,. eh?. Are you still with me? Hello?

Is someone else on this line? ... Yyyou'll never catch me.'

Marc "Johnny America" Grossman "Any country that doesn't go
along with US will be paying a very heavy price."

CNN Admits 9-11 Inside Job
http://www.youtube.com/watch?v=uyMIqVfH8zY

Patriot of Great Britain arrested for sending
"7/7 Ripple Effect" to judge and jury members
http://truthaction.org/forum/viewtopic.php?t=4999

/ / Anthony John Hill, originally from Sheffield,
was arrested on Carrig Street in Kells this morning
on foot of a warrant issued by the authorities in
Britain.

It is alleged he sent DVDs entitled "7/7 Ripple
Effect" to the jury, the judge and members of the
victims' families. \ \

All of Great Britain joins US in demanding
the "Judge" to face trial for death sentence.
Peter Power "did" the 7/7 bombings. Ask
Netanyahoo, he knows.

-

Report Of ï¿½People Planting Bombsï¿½ on 9/11
http://www.prisonplanet.com/report-of-people-planting-bombs-on-911.html

Why isn't Happy George Norry, Our Enemy, covering
this everyday as an important subject to defend
American life he holds truly in contempt?
Again, Alex Jones leaves every American to die
victim to his NWO, before he will acknowledge
TRUE evil in our world. George Noory, the evilest
ACTUAL Enemy of History, Alex claims is a good
guy for never allowing open discussion on 911,
Afghanistan, Iraq, and so on, without selling
his Zionist hate for our Humanity.
allowing the notion that he, and
his likewise cult, might just have something to
learn about evidence being a REQUIREMENT to prove
someone's guilt or innocence. His godless commitment
is to escape Bush, and his zionist media controllers
with excuses that don't hold water in any Court of
Thee. Alex refuses to allow Americans to know why
the Constitutional protections are there to defend
yourself, because if you did, you'd demand the
arrest of Bush for treason, and call Ron Paul a
sell out loser who pocketed the millions conned for
being Alex's loyal fans. Alex doesn't like this Truth

because he's gotta be leading Earth's "Truthers"
at the pinnacle of his spear as a liar, where all
of History, is one badly drawn Alex Jones cartoon.

I must be on crazy pills
http://www.uruknet.de/?p=m51615&hd=&size=1&l=e

/ / Well, why haven't the banks just returned
the money?... \ \

People who know they defeat all "Conservatives"
in seconds with indisputable simple logic, will
eventually rule the Universe, if CNN, CBC, and
Alex Jones allow open communications on what is
understood by all as high acts of treason openly
committed without a defense of smart people
explaining why/how we are being rooked as idiots
on purpose. Crazy man, crazy.

Oh, logic like, "Buying in bulk is cheaper."

"Army deserter deported from Canada, now in U.S. jail"

This is a for real war crime. Why? there was/is
no cause for the Iraq war. Truly. Example: why
bomb if you can go anywhere without delay? To
only murder innocent People INCLUDING SOLDIERS
to thieve from ourselves as war criminals is what
any rational person comes to understand. When you
destroy bushite grunts who war God for rape, torture,
and enslavement of our species, you save the
innocent lives of their next victims. To hunt
the godless bushite enemy, is to love Justice
as our glorious Humanity winning over the lawless
nazi grunts of the Third Infantry - who'll shoot
anybody, blindly as cowards, led by a Saudi, Buford
Blount. Their "leader" who left Iraqi's largest
weapons depot undefended for looting. Qaqaa. Killed
many a bushite nazi grunting lawless coward by his own
treasonous brand. And mumbling bushite nazi grunts have
what to say about American teens made valueless
victims for Neocon bounties? "whore yay" That's
about it..

LETTERS NOW RELEASED PROVE-Bush Intervened-To Suppress Torture
Evidence
http://www.democraticunderground.com/discuss/duboard.php?az=view_all&address=389x4994330

This is called ungodly nazi war crimes against
innocent Human beings.

Obama Gets Tough to Shield Bush Torturers
http://chris-floyd.com/component/content/article/3/1694-protection-racket-obama-gets-tough
-to-shield-bush-torturers.html

Who does Obama think we are as 'United' together
on pro lawless torture against innocent 'others'?
Wake up people, we are under attack by those
who refuse US Justice to win Freedom for
anyone. "Conservative" retards are completely
lost here, because they do not have the
intellectual skills necessary to understand:
a person accused of a criminal offense without
any evidence is innocent. Or, how about, No one
deserves to be tortured for confessions on
crimes left then unresolved for actual
retribution. [Aegis OPENLY murders innocent
families for more American paying for zionist
monies - P2OG - YOUR Spouse, YOUR Child, YOUR
family].

Following the crime scene leads of 911 to nab
the actual evil doers is beyond the will of the
deaf, dumb and blind? with lawlessness gaining
for monetary loses due America as corporate
cheaters. We are Brilliant, of that much I am
certain. Conservatives are minimally, idiots.

-

Israelis forced mother to choose which of her children would die
http://www.daily.pk/world/middle-east/9374-israelis-forced-mother-to-choose-which-of-her-c
hildren-would-die.html

/ / the soldiers told her she had to choose five of
her children to ï¿½give as a gift to Israel.ï¿½ As
she screamed in horror they repeated the demand
and told her she could choose or they would choose
for her. Then these soldiers murdered five of her
children in front of her. \ \

Funded by the American tax payers as a gift to
God as our stolen Humanity. Equal rights for all,
especially the Taliban's position in defense of
America, demanding evidence to form our guilty
verdicts.

-

Obama Accused of Blackmail over Terror Trial Evidence
http://atheonews.blogspot.com/2009/02/us-accused-of-blackmail-over-terror.html

Again, Obama is taking a position to torture innocent
people here as a traitor to Just cause. Just cause to
live in a free society. Torture warrants the death
penalty under American STANDING Law.

Video: Cop Punches Woman In Face Four Times During Arrest For Riding A
Bike
http://www.liveleak.com/view?i=99c_1233639102

Top Cop Johnny Judge rules: Five years in prison.
Maybe fifteen if the dumfuk grunt, back from the
war against Iraqi children as a traitor to American
values, shows no remorse for his crimes against an
American women either. Absolutely any cop or soldier
who disagrees as true contempt for our freedoms with
punishment against this nazi trash pirating our
police uniform, WILL WARRANT death sentences all
around to ACTUALLY defend liberty in my America.
Any American father who prides in killing innocent
Iraqis for the escape of the neocons for 911 is no
father. And a wife should get the hell away from
a male who enjoys murdering helpless innocent others.
Children in such families should be challenged
by relatives through the Courts to save the lives
of our endangered offspring. Again, without water
or food, Iraqi children are murdered by Neoconner
grunts irrationally everyday with nothing to say,
aka, without reason but as Satanic Bush whores, to
make our God as Humanity suffer further for their
escapes as actually selling freely, lawless zionist
savagery.

KILLING MORE OF THEM - reporting war crimes to the Police
http://www.youtube.com/watch?v=gB-KaIBDNJw

Again, a bushite has no commitment to defend
America, for it speaks nothing for the arrest of
the neocon traitors. traitors like themselves whom
will murder innocent folks like your Self to steal
our common values. Wouldn't you glory in seeing
these savage grunts who on video, indiscriminately
shoot innocent families, or bomb a city entirely,
executed by Christian Patriot firing squads? or
televised to fry in the electric chair for these
documented war crimes? I sure would. It would make
our world a much safer place to raise a family
secure in knowing, bushite grunts as enemies of
everyone, were hunted to extinction for their
crimes against our Humanity. Hunted by Johnny Law,
the True Spirit of America.

Johnny Law for Coast to Coast radio Host!

yaahhh im a real person! Wow eh? Now,
let US bag some bushite scum for the Gipper.

UK judges accuse Obama Administration of suppressing torture claim
http://www.timesonline.co.uk/tol/news/uk/article5661291.ece

Yeah really. What kinda world does Obama take US
for here? Does he actually believe we hold no
interest in being attacked as ourselves, the
innocent forsaken? A reminder: an American was
executed under Iraqi law without any evidence
brought against the accused, while the grunts
were offered an excuse to seek not the culprits
at the terror scene. The case was lightly reviewed
at democracynow, a year or two ago, and can be
found by searching for a grunt pretending to be
an ambassador to Romania. A case where the Judge's
life was threatened by a "General", where if he
didn't order the death of the innocent American
citizen, the grunt with the General would murder
US all right then and there. The Innocent American
was murdered as forsaken for value shared by
free men. dying.

-

PetBed-CatTree
http://www.petbed-cattree.com/cat.html

Hey! this stuff for cats and dogs looks pretty
coool. Check it out if your a pet lover!

Near Impossible to believe!

/ / "similar themes go through all our streams. And it all
comes back as Confucius says, "Do unto others, as you would

have them do unto you." And Christ said that, Hillel said
that, Buddha said that, everybody says that, cause that's all
it is. But bushite, he wants to accuse People of criminal
offenses without any evidence, and indiscriminately slaughter
everybody in countries, for no good reason but to be OUR
ENEMY, an ENEMY OF ALL PEOPLE." \ \

-

AG Holder-- First, Jail All Bush's Lawyers
http://www.consortiumnews.com/2009/020309.html

For actual documented criminal actions against
American interests in defending ourselves from
indiscriminate robberies, tortures, or mass murder.

"Judges Bribed by Private Contractor to Sentence More Kids to Juvie
Detention"
http://www.philly.com/philly/opinion/inquirer/20090128_Editorial__Judges_Sentenced.html

Christ speaks!! Echem.. This is called a criminal
action to falsely imprison American children for
more stolen money. Will the contractor be arrested,
tried, then executed in America to defend American
children? Unlikely, because it isn't as important
as how fat Oprah is today, or as Alex Jones the
bigot would say, on how daily, the hidden NWO elites
are responsible for every criminal action against
Liberty in America, not war crime dictating LIAR
Bush who told US Saddam wouldn't let the inspectors
in without corporate news correction, Bush, who
closed Police investigations on 911 for Enron, KBR,
and the Kissinger associates. And certainly not
Bremer for personally stealing tens of billions,
no no no, "just puppets" "just puppets" as instead,
the Illuminati in other words not allowed spoken
understood with Alex Jones NWOers. I want a free to
speak arena where 50 percent of what Alex spews is
truly dumber than stupid. Why? because he is controlled
through his personal weakness of bigotry, to actually
believe foolish things as factual. Examples are
truly endless when we discuss Alex Jones'
dumminess, but here is one example. Alex states
911 truthers were attacked in a TV show as NWO mind
control- but, the "truther" he referred to
talked in the drama on there being NO PLANES!
A dis-info bushite stooge if ever was one depicted
with special effects. We suffer with his bullshit
every day, knowing if we tried to phone, would
not be granted a minute because I, in support
of Freedom for America, make all bigots look truly
dumb as fascists lashing out at nothingness to

divide our masses. And apparently, he can't have
America becoming greater for defending ourselves
fairly through Judicial actions. Yet.

-

which side are YOU on? by REBEL DIAZ
http://www.youtube.com/watch?v=8Dr05tXktSo&e

The side where a person accused of a criminal
offense without evidence is innocent, and in the
case of capital accusation, the false accuser
deserves severe punishment as an enemy to my
Humanity.

http://houston.indymedia.org/uploads/2008/06/johnny_the_law_man_america.mp3

Again,
Nazi Israeli responded by murdering innocent Christian
children as war criminals with "disproportionate"
force. War criminals who murder Humanity to steal
our shared values.

-

Dennis Kucinich "Israel is Killing Children With Your American Tax
Dollars"
http://www.youtube.com/watch?v=HrtPpk6nhF8&feature=related

Israeli openly admitted that they targeted those
innocent Christian children for MURDER - as -
continuing "disproportionate" force in our names
as enemies of God and Humanity. They are not Jews,
but of the evilest group of lawless nazi savages
pirating the government of Israel away from US Jews.
I demand open debate in America, and Americans refuse
me by not likewise demanding international coverage
on the Coast to Coast radio networks. Let's change
this by communicating.

Ceasefires, Israeli-Style
http://sjlendman.blogspot.com/2009/02/ceasefires-israeli-style.html

They admit TODAY, as yesterday, and last week, month,
year, decades, that they target completely innocent
people for murder to punish Humanity for believing
in God as Just, or real freedom understood as practiced.
Libertarian couldn't give a shit on a issue such as this,
that they keep everyone ignorant of through hypnosis. Israeli
openly admit to thieving innocent peoples homes, to them
be sent at gun point, to live in a concentration prison
death camp.

http://www.davidduke.com/

/ / ..the Israel Prime Ministerï¿½s speech in which he
actually boasted of his power to order the U.S. President
as one would a dog. \ \ and all American men can't for
some god forsaken reasons, can't for their lives, phone
George Norry to be hung down on. George Noory is a "good
guy" for aiming to go ballistic against every American
who refuses criminal orders to destroy themselves.

Obama set to allow Bush-era ï¿½torture flightsï¿½
http://timesofindia.indiatimes.com/Obama_set_to_allow_Bush-era_torture_flights/articleshow
/4067338.cm

What the fuk eh? Doesn't Obama know this
crime warrants death in America according
to the war crime act? Does he believe America
just will never have a chance to speak for the
interests of US as innocent Human beings he is
planning to torture as an enemy to Life?

Refusing to Defend American Values

Yoo: Bush okayed torture to outwit defense lawyers

This is why it warrants the Death sentence. Remember
corporatist Amerikan citizen, these torture victims
that include children as younger than a hundred, had
not been alleged to have ever committed a crime in
their entire lives. Victims tortured to death for the
pleasures of those Satanic, such as General Geoffry
Miller, who tell US today as confidenced, they do it
because, patsy wasted American soldiers will just refuse
to hunt them down for formal executions. Let's change

this for our Humanity in this future, to look back,
and know, American males were men of the World, who
stood for the principles enshrined within every living
Constitution. A free man shall not be jailed, or
tortured by anyone in our names as Governed, without
the perpetrator tried publicly for execution as our
Love of real Justice. As first degree mass murderers
warranted death sentences under the War Crime Act
ushered by Reagan!, all done in for our protections
of their next innocent victim - ourselves. Or
die a death in corporate tyranny worthy the title,
cowardly traitors to God and Liberty. Blackwater,
CACI, AEGIS, KBR and the like will all be hunted to
extinction for refusing to quit their lawless Rape
and mass murder, murders done for more stolen money
as America's name high-jacked. The Lawless enemies
shall be prosecuted by the honorable Soldiers of
the Good old, Red White, and Blue. Count me at
our words on this, I am,

King Johnny

Ungodly Israeli Nazi LIARS Continue to Murder Children after "Truce"
http://www.youtube.com/watch?v=-HQO0774lx4&feature=PlayList&p=4199C9262539936D&index=0&pla
ynext=1

A truce means nothing to Hamas?, who states
much of no complaints as in support of Israeli
Nazi lies, why? Have you seen where a blimp is
traveling about five miles an hour, fire bombing
thousands, and none have even a pullet gun, never
mind an Iranian rocket launcher to shoot the Satanic
demons down for God as Love? Why doesn't Hamas
at least admit, like an Israeli General has,
to be funded by Zionists for cash gains paid for
by Zionist Amerika? Why? Why is it that Hamas
suffered near no loses, but all the Cops who
voted who knows, died murder victims trying to
defend our family from Texan child rapists?
Along with thousands of others targeted as
innocent Peoples? Targeted. Why? Nazi Israeli
broke the truce!! THINKTHINKTHINK Demand coverage!
Hamas certainly isn't. ..maybe because they're
illiterates on the Cause of God's Will being
Just?

From years after the fact still demanding Justice now:
http://groups.google.co.uk/group/alt.military.uk/browse_frm/thread/ca0e34fb32caeb0a?hl=en&
scoring=d&

Huh? "at last been disarmed..." ? How does he figure?
The equation hasn't changed. Example: The same
unaccounted anthrax, (that was disintegrated into ash),
still is not able to be measured as completely accounted
for, (never could be), but this bushwhoring war crime
apologist, tells US, it was only though the lawless
murder of our good friends and family for countless
generations, that he now attests without reason, or
evidence, to find Iraq in "fact" disarmed of it's still
nowhere to be found, weapons of mass destruction. (An
irrational reason he pronounced previous in corporately
broacasted public support of instigating heinous war
crimes against our humanity under the leadership skills
of the evil lying demon antiChrist, our Mr. bush Jr..)

Ron Paul defeats 5 TV 'experts' in 10 minutes
http://www.youtube.com/watch?v=0k92fTDReHg&e

Ron Paul is a traitor. They stole the cash Ron.
And, the Iraq war is a war crime. But Ron, the
Fascist, doesn't want THESE FACTS uttered. Why?
Because wiser men would prevail, wiser men like
me who understand buying in bulk is cheaper. Those
like Christ who understand, who KNOW, the banker
doesn't cover our loans - so why give them as much
as a taxed red penny?, let alone trillions as
officially unaccounted for? They are stealing the
cash Ron. Ask yourself: Why has Alex Jones
forbidden his bushwhore cult from understanding
Bush doctored the NIE?, or of iron flowing like
water from the towers? Because wiser men would
prevail and he can't have that. He called shooting
innocent men in the back, an act of liberty. I,
an actual god, unlike Alex, lie near never, but
maybe to myself when I'm lonely. Alex yes will

tell you rapists are free to do what they will
in Texas to American children, un-arrested, but
he won't mention it when the police chief is with
him on air, talking about how he'd like to be
exempt from traffic tickets for being so popular.
NO MENTION of the rapists walking away without
arrests made, no mention of Bush's documented
treasons on 911. Where are Alex's priorities?
In selling YOU out so he can be wealthy like a
bankster?, and have special rights over everyone
else that drives drunk, or speeds? a big hero
standing over our dead soldiers yelling, I told
you so, I told you so, I was right, I was right.
Again, understand: It is not by my will to deny
open debate with America, it is Alex, and his
demon buddy George Noory that denies out Humanity
this right. And when people try, like Peggy, or
Black men on Jewry, Alex lies cheats and steals
our wills for further thefts. Ron Paul's family has
millions taken from loyal Alex Jones fans. MILLIONS!
Does Ron do commercials with that money highlighting
the bushmob's plan to invade Afghanistan, dated two
days prior to 911 for Enron? Of course not, wiser men
would prevail to expose him as the charlatan charity
raider he is regarding Health Care, Social Security,
Public Schooling, earmarks.. It is unfair to measure
Ron against corporate nazi zionist whores of MSNBC who
willing, openly, kill American teen soldiers for
criminal neocon gains, as an honorable gentleman's
talk. Half honest People like Ron are extremely ignorant
on the workings of our world. EXTREMELY. I joke here not.
Evil is the deceived disguised - translated - evil
people are always dumb.

Corporate America says no, Charlie Manson was a genius,
but not, that most Americans are prone too easily to
suggestive states where they can be made to believe
anything blindly. Think: what does, "bin Laden did 911"
mean anyway? You should know of what I'm trying
to teach you here. That is how
Alex knowingly or otherwise, steals our rights, by
beating off he knows everything already. And some,
if not most, actually believe him without knowing
squat either. It's sooo easy that way - no study
required!! LIBERTARIAN HELL! Everything is not on
the Internet, where it near should be, but regardless,
a Libertarian can't be bothered to read anyway.

It's YOUR life. It's God's
Gift. Now support our rise for popular international
debates to get these Neoconners behind bars

awaiting Public Trials! "Public"thatsoyu!! Get to
the Phone to call someone to care man.. Johnny
Jesus has arrived! Justice Will Be Done in this,
Our Kingdom to Come.

Justice to the war criminals of
indiscriminate warfare would better serve ourselves
to halt for our safety. The bushmob did 911.

1. The ISI's General, Mahmoud Ahmad funded 911's Atta

2. We have video of iron flowing like water from the towers

Humanity Under Attack by the Zionist Enemy of Life

GAZA APPEAL THE BBC & SKY REFUSED TO SHOW
http://www.youtube.com/watch?v=c9kwpxlZorI

Not only that but the BBC argued that to show
innocent Human Beings suffering, in CRITICAL
life threatening need of desperate food and
water that Israeli nazi stole, (because they are
unlawful murderous thieves), would have them look
like they were partial to serving Humanity's
interest in compassion for US humans. Over the
Israeli terror Nazi tactics of indiscriminate
slaughter for more Amerikan welfare. Wicked evil
nazi bastards who too, DO NOT THINK IT BEST to
report Peter Power committed the London bombing.,
Oh yeah, and mercury is neural toxic, anti-psychotics
make us crazy, and sodium fluoride makes us
stoopider while weakening your body for big cash
surgeries

Olbermann | Bush Years: 8 in 8 Minutes
http://www.truthout.org/011809Z

Bush and Cheney are traitors to the cause of
American Liberty. To leave them free, is to leave
America un-guarded from further transgression.

The bushmob doctored
the NIE. Conned Congress, and Soldiers. Did 911,
by closing criminal FBI investigations immediately.
Alex and George don't seem to want US to know
these FACTS that demand arrests of the culprits
responsible for high treason against Johnny's
America. Alex wants your money, and EVIL George,
our enemy, wants your soul stolen for Satan.

King Johnny Guest Caller on Free Mind Radio!
http://67.212.67.19/PubPodcast//freeminds/0125091.mp3
(back-up) http://www.mediafire.com/?ptui9mm15pn

The demon LIAR zionist Israeli is a godless enemy of Humanity, much like everyone at Foxnews, CNN, BBC, and the CBC. Our revolution against the godless bushite shills, will not allow our revolution through speaking honestly, (to become of ourselves something greater), a chance to be televised for our benefits. Bush closed criminal investigations immediately after 911. According to the FBI and Senator Daschle. CNN says you have no power, Foxnews says you have no power, the BBC says you have no power, the CBC, the same, like Alex Jones NWOers... but well, don't believe it. YOU Do have the Power.

We must demand open communications to bring back values WE ALL would agree to through polite debate. "Conservatives" don't want this Freedom idea expressed in general terms because, a "conservative" is universally, minimally. a bigot. Why? Life isn't like, their way, - then- all other opinion under the sun on how things actually get done. (Aka "socialist" traffic light repair men, or "liberals" who want to treat The People fairly). Or who we are as equals to our laws fairly practiced. Pay attention to what I am saying here. Liberals can be Dicks with a capital D too of course. But a Hannity couldn't survive 2 minutes with me speaking on his very real treasonous behavior in OUR public arenas. Behavior done to escape the 911 culprits from the long arm of the Law, with his conscious will of criminal deceit exposed, we all learn to better defend ourselves. And Shawn Hannity can't have that for ourselves, he takes too much money from ourselves as talentless by keeping US in the dark dying needlessly for traitors never elected publicly.

-

Unseen Gaza High Quality: Part 1 of 6
http://www.youtube.com/watch?v=UeezoWRu1FU&eurl=http://whatreallyhappened.com/

Why is it that numerous visits don't change the view count? What is this business of a=a+1, the top secret, I'll go rhythm, that is way beyond our comprehension in it's scientific complexity? For Americans, okay, but the Human species just isn't this dumb.

While Zionists OFFICIALLY target Christian school girls for mass murder, CNN instead reports that bushite grunts attacked girls in Afghanistan, posing as Taliban. I WILL every celeb at CNN to be arrested, tried and executed for the reporting they have done today without facts. Remember: the Taliban played no

part on escaping those responsible for 911, and opened
schools for girls, and were brought together on the
single purpose to defend women. Death to CNN reporters
to LIE for killing OUR school girls. I HATE zionist
enemies of Humanity and God I am.

The Torture Ban that Doesn't Ban Torture
http://atheonews.blogspot.com/2009/01/torture-ban-that-doesnt-ban-torture.html

/ / Obama's Executive Order bans some -- not all -- US
officials from torturing but it does not ban any
of them, himself included, from sponsoring torture
overseas. \ \

Is America a nation of Law to Live freedom?
Because this SPECIFIC deviant action of Obama warrants
the death sentence under Reagan's "War Crimes Act".
SPECIFICALLY. Or, is it you falsely believe Obama
can do no wrong against innocent people here, where
an illiterate nazi grunt, maybe from South Africa,
will kidnap YOUR children, and torture them to
death for sadistic pleasure, with as they did using
power tools caught in Iraq, according to Iraqi
government official(s), and several soldiers from
Oregon, all because Obama has given an ILLEGAL!
"excuse" to NOT support following the crime scene
leads at our REAL murder scenes? Again, death to the
bushite dumfuk enemy of God, death to the enemies
of a freeing Humanity striving for a just society.
Obama needs to be arrested for this under the Law
as it stands I'm sorry to say my friends. Why?
Torture is illegal in all 50 states, (as Reagan
directly planned), no matter where you ship the
innocent victim to, or from! Read the War Crimes
Act, then demand Justice today, otherwise, it's
YOUR funeral. Obama wants to secretly torture
Peoples here, while lying to US ALL that he doesn't!
A TRAITOR! Who also wants to give bankers 100s of
billions of dollars more to disappear, that WE pay
for, out our door, never to be seen as our own
again.

-

Don't miss this..

-

Jack Blood interviews Richard Andrew Grove, an AIG insider and
whistleblower
http://video.google.com/videoplay?docid=6546044203900048624

Alive We Say

And Alex Jones gives us the same guy twice
a week that blames the Illuminati, while
encouraging that YOU TOO! can get money
for nothing like the banksters. Just give
the Alex Jones', NWOers, the "truthers" money
money money money. No time for affording the
explanation that the TREASONOUS bushmob
doctored the NIE. That Saddam wasn't in
violation of 1441. That a NEOCON is
identifiable for it's demonic LIES
against God and Man. Never to tell, the
private bankers don't cover OUR loans,
that Bush PERSONALLY worked to close
Police investigations immediately after
911 (obstruction), or that WE have video
of iron flowing like water that PROVES,
without doubt, bin Laden couldn't have
single handedly placed the explosives
in the buildings, or stole the black boxes.
Because someone surely would have spotted
him dragging his dialysis machine what with
all the professionalism of corporate news
media coverage regarding our horribly
suffering worlds. Alex Jones ignores the
treasons of Bush, as a Bushwhore, and
instead, tells US of how Obama is Bush on
steroids. He only wishes. What about
Justice for Americans Alex? Why for do you
forsake ourselves? For money? What about
the lives lost to mass murder, that you
allege to champion OUR TRUTH without saying
much of anything on real Freedom?, on real
Justice

King Johnny, from Earth, has come for talks.

-

The Zionist enemy, the most evil nazi sons-of-bitches
who openly advocate tyranny and oppression through mass
murder of ourselves as the innocent left targeted
defenseless. Enemies of Jews everywhere, the Zionist
cares not for facts on who's Life it destroys for stolen
gain by lying. That's why they target Jews, for fear the
Light of Truth would expose them as the Nazis they are.

Hamas doesn't have a military though, so,
why not demand the arrests of those who
broke the truce, and murdered innocent people
indiscriminately, on plans more Jews would
die for cash profit? Profit paid for by

zionist amerika? - the false imprisoning
torture and rape center for Neocon
Freedom.

The self-defence defence
http://www.guardian.co.uk/commentisfree/2009/jan/23/israelandthepalestinians-gaza

Court petitioned to arrest Livni upon arrival in Brussels
http://nawaat.org/portail/2009/01/23/belgian-court-petitioned-to-arrest-livni-upon-arrival
-in-brussels/

"We believe there were dozens of IRGC
personnel in the Gaza Strip during the
war," an Israeli source said. "Some were
killed; others went into hiding, and
others escaped."

See? the demon enemy of God speaks no
evidence as a TRAITOR to every Jew. A terrorist
nation that still steals humanitarian aid in
our public realm of left defenselessness. The
false allegation deserves a death sentence
by Jews against the war monger Zionist enemy.
A cause that Iran should champion, if in fact!,
this allegation by OFFICIAL WAR CRIMINALS WHO
TARGET FOR MURDER OUR SCHOOL GIRLS, is on it's
face, unsubstantiated as patently, demonically
false. As typical from any godless Zionist.

Obama! feel free to call
on me to help out with a plan for judicial
actions. That offer goes out to everyone in
Palestine, Canada or Britain too. Russia,
let's help out these fools by freely
communicating, what say you? Justice
for all is freedom to be. The Israeli cop
killers must be brought to justice for war
crimes. Those cops, were cops. And I,
am a man.

A Dumb
guy on things like economics sure, Justice, warfare,
Health Care, Social Security, ect. ect. but still.,
like a child learning of why the sky is funny
blue, isn't all that bad a guy really. He's
certainly not a war criminal, like Bush or
Rumsfeld are. Doing 911 then sanctioning torture.
While Neocons Champion sending illiterate American
teens for death as war criminal. Think about it.
Maybe he is..

-

ï¿½We have all these documents that are now publicly available that prove that these methods of interrogation were intentionally ordered by Rumsfeld,ï¿½

Let us understand. These actions "give" a guy like Willie Brand "the right" to RANDOMLY kidnap men, women, or children, and torture them to death for sadistic pleasure with his Capt, Christopher Beiring. (I think that's how it's spelt). But anyway, this is the truth. A bushite is a godless Zionist whore of Nazi evil, an enemy of America, who wars YOUR Freedom with criminal "excuses", for refusing to support the arrest of those responsible for 911. A TRAITOR, and could be wannabe rapist, robber, or 911 mastermind ringleader. Torture is illegal, and warrants the death sentence, according to, Reagan's "War Crimes Act". Some only suggest, that this was why someone tried to kill him as honorable. Death to the torturers of our innocent families, torture they do without apology as Zionist Military "Judges". Instead today, where they get salaries paid in the billions by the zionist giving nation of, a-mirror-kay, echem, America. Johnny's America. A nation where Justice will rule for the favors of all treated equitably with or without you. Honor me in company my friend. We have no rivals.

"they do not understand, the private banker never covers the loan. Never does a private banker reach into it's pocket to borrow US to begin with - so as a consequence, the bankers have just pocketed all the 'free' loot for nothing, TRILLIONS, and are not saying why should they help anyone else up with charity?" Then went on to say, it wasn't any of our business with what they did with the money. (But for to cover criminal fraud in the derivatives market, where the true value of said commodities were backed by ZERO capital. ZERO DOLLARS. WORTH NOTHING. So, think about who's truly giving it always here until Johnny, the man who came out of nowhere, arrived to explain everything in five or six minutes.

Gaza: 'I watched an Israeli soldier shoot dead my two little girls'
http://www.independent.co.uk/news/world/middle-east/gaza-i-watched-an-israeli-soldier-shoot-dead-my-two-little-girls-1452294.html

Getting away with murder as 'God's Chosen' chosen
for death by war crimes trial more like. Death to
the criminal zionist enemies of Humanity. Zionists who
falsely accuse without evidence to respect our rights,
like TV corporated Americans who treasonously LIE,
'bin Laden did 911'. Enemies of Freedom for our
Humanity.

They are murdering Cops

2-Bombings target house of Abu Ubaida El Jarah,
Police Director in Sheikh Ridwan area.

3-Airstrike targeting Al Zaytoun police station.

Nazi Israeli are murdering Police Officers,
and the families that live in the areas near
them as once defended from criminals.

It's like saying, every Cop in America deserves
a death sentence by thousand pound radio-active
waste based uranium/plutonium war shells because
Bush stole the election, then committed 911 with
the Neoconned Partners of Public Crimes, Cheney,
Rumsfeld, Condi with General Ahmad and Myers. Now,
I ask all Cops, does that make sense to you as
still remaining silent? You can be a man too, why
don't we all just give it a try. To the Telephone
Robin! Israeli are attacking prisoners held
criminally in their own Death Camps!! GET ALEX
JONES ON THIS! and.... the ADL! er.. JDL.. er..
let US join forces for the common good of all,
as so we will benefit everyone. That means
Justice for all, especially the Taliban for
defending American Freedom by demanding evidence
to form a conclusion of capital accusation,
regarding an unsolved case of mass murder.
Taliban blamed it on concern for life draining,
!AMERICAN ENTERTAINMENT TV! sports, weather,
Music, and news about some, who knows war we are
committed to now die you for, for better or worse,
of mass death and suffering against innocent
Peoples all for glorious Neocon tyranny of inter
national private banker IMF enslavement plans!
in some far off distant places. America! I am
King Johnny.. I am from the Planet Earth, I've
come to share the knowledge of Justice in our
times on behalf of this, Our Future Great
Triumph over Evil. We come in Peace with
a sword for War Mongers, and a choice for
'lawless' grunts of ungodly action against
Life as we live it. Targeting school kids
deserves death sentences, don't you think this

value is what every soldier should hold proud
with Johnny in America? In Israel? In
Everywhere?

Chief Israeli Nazi Rabbi "All civilians living in
Gaza are collectively guilty for Kassam attacks"

ï¿½In spite of rising the blue flag of UNRWA on
our schools, the Israeli army has been targeting
those schools by missiles and tanks shells.ï¿½

U.N. special rapporteur on torture calls on U.S. to prosecute Bush and
Rumsfeld.

[SATANIC ENEMY] Israeli warplanes attack Gaza during Truse
http://www.presstv.ir/detail.aspx?id=83073&sectionid=351020202

Satanic Enemies of Humanity Kill 8 Yr Old Girl During Fake 'Ceasefire'
http://uruknet.info/?p=m50983&hd=&size=1&l=e

Nazi argues it's good to get killed Jews by
breaking truces with prison camp.

They shoot Peoples indiscriminately telling US
that's how evil they are to argue it's Your
fault though.

FIGHTBACK

/ / Israeli forces demolished the house of the
Sammouni family in Gaza City after ordering
them to remain in it for safety. \ \

Palestinian Children found with bullets lodged in their head
http://jnoubiyeh.blogspot.com/2009/01/palestinian-children-found-with-bullets.html

/ / Israeli officials continued to deny on Saturday
that their soldiers had deliberately targeted
civilians, \ \

The Zionist is an
enemy to the God of Love and Justice, of Beauty, and
Children. A zionist LIES with a hatred unmatched in
Satanic hatred for the survival of our species. I
beg you, hunt to bill the zionist war criminal who
charges we will not succeed to see every last war
criminal on this planet hunted down to complete
extinction, by public trial, then Jewish firing
squads. The Zionist has bombed US, The People
indiscriminately with out cause. It was Nazi
Israeli that broke the truce to get killed
Jews for money. They starve Jews in Israel
to attract more charitable aid they can use

elsewhere. They, as Nazis, will continue to
murder Jews for money unless WE DEMAND, their
formal trials and public executions. They have
murdered our families, and they will pay will
their lives for it as the directly responsible,
and in no way, will escape our rages against
them as the enemies of every Human Being
Living for Freedom. Every Human that loves
children. They HAVE ADMITTED to targeting the school
girls for murder with lies they were caught
doing. THEY DON'T GIVE YOU EVIDENCE. And when we
get the facts, it's near always exactly the same
thing: they steal our Homes, they STEAL our
lives. God calls the Zionist Jew Enemy of
the Synagogue to Satan!!

The Ungodly Murder of Innocent Men by Israeli Nazis
http://atheonews.blogspot.com/2009/01/summary-execution-in-southern-west-bank.html

/ / At noon an Israeli military jeep with four
soldiers entered Tameiziï¿½s land. After 15
minutes the man was thrown, blindfolded and
still handcuffed, into the back of the jeep. \ \

Let us not lose the focus of fact, that these
people of ourselves live in a concentration,
prison death camp, robbed of everything.
in Curfew near anywhere in "peace time". And
still, to this day, do Nazi Israeli CONTINUE
TO THIEVE the Homes of god loving folks in the
region, guilty of no crime but to have been
born into such brutal ungodly oppression
against Civilization. And to see, face no TV
opposition as American tax payers continuing
to fund such war crimes in our absent names,
is a crime on to ourselves if allowed to go
unchallenged. Johnny for Coast to Coast radio
host. Free the Slaves! Free the Slaves!

Binding U.S. law requires prosecutions for those who authorize torture
http://www.salon.com/opinion/greenwald/2009/01/18/prosecutions/index.html

-

The ugly secret of Barak and Livni, the truth about the Gaza rockets
http://www.youtube.com/watch?v=8rqDzXeA-PQ&feature=channel_page

[HEY WHAT THE.. THE LINK IS GONE ABOUT GODLESS
ZIONISTS MURDERING JEWS IN ISRAEL FOR MONEY!]

See my Jewish friends, these zionist liars
will never escape our love for Truth in this
our new age. Killing Jews for money is as

evil as found, negligently criminal, agreed?
Agreed.

Gaza: lives in ruins
http://www.youtube.com/watch?v=OFWxEtWcT8w

'Ungodly Enemies of Life is the only way
to describe it from here Tom. They again,
are attacking People indiscriminately for
murder as sadistic Satanic enemies of God'

Someone should ask what King Johnny, The
King of the Jews has to say on this subject
of a Zionist's complete absence of morality,
as inhumanly bereft any common decency among
our brothers and sisters. I mean for Christ's
sake Tom, THEY ADMIT to sadistically
targeting our children for MURDER - as some
kinda Satanic demon whore to Pure Evil - aka.
Wanted War Criminals for Public Trial. Just
as the Nazis were for similar outrages. Let's
hope men of America are least half they were
then, but we are suspecting, they will as of
usual, balk as cowardly slaves to the private
banker man ruling their minds, it's a, no
wonder. Where is there that purpose striving
for a greater future living in a just society?
Where is the Christ in their Christianity?
to financially support the arming of such
unlawful Zionist killings in silence against
Innocent Christians?

BBC argues with Israeli Spokesman over UN School Bombing
http://www.youtube.com/watch?v=VPGP1xWEkkk

Where is the evidence to form any person's
verdict, if none is offered as in respect
for yourself as worthy the title of free
men? I ask as your self? Or are you as
the cowards of most in the American military
who refuse to speak for the arrest of those
who did US wrong on 911.?

King vs Obama on Gaza - Christian vs Zionist
http://www.youtube.com/watch?v=oegClx-t20U

-

For the Popular Will?

Alex Thomson shuts-up Israeli spokesman!
http://uk.youtube.com/watch?v=zIQZ1-RFq6A

Wow. The demon LIAR will also say Hammas broke the truce, and Israeli started this by stealing innocent peoples homes, then imprisoning ourselves, the victims, in a death camp for indiscriminate slaughter. While they continue to STEAL OUR CHARITY by breaking truces. What is it that YOU can't picture?

"The view from the other side, that the Qassams are a retaliation for the siege that starves the one and a half million inhabitants of the Gaza Strip, [a prison death camp,] was not mentioned at all."

They are criminals who murder People in hate for a freed Humanity. They OFFICIALLY steal Peoples homes in that country didn't you know they proudly proclaim it so? And steal humanitarian aid from starving children. Targeted to murder children specifically as publicly confessed, 'it is Hamas WE blame', not them as demonic child murderers. Hideously evil as ungodly sadistic savages. Enemies of YOU, enemies of them, and enemies of me, the King of Jews Christ fellow from beyond the grave. They are so evil to God and Man, they tarnish everyone of US to not win justice sooner by blaming the actual bad guys. Justice is Freedom.

/ / Those white phosphorus shells used on the Gazans are made in the USA according to Jane's Defense. \ \

Again, these peoples are not Jews. Being Jewish is a religion. These thieves of God are Satanic in their LIES to betray the common trust in our words, that bind all worlds to victory, called freedom universal. Even tales of the Devil have him keep his word, with verses specifically condemning the self to damnation for targeting the innocent for death. God's the Word. Every word inside a fool's paradise. Including the periods. Not as like, I'm playing a word game, but that it in wonder, is all strangely here. Example: The Universe as it has existed always, is not separate from our 'pauses', or faulty drawn conclusions. The universe, in one sense, was as good as anytime, created 6000 years ago. AS TOO 50 billion. You say, impossible, I say no, study quantum physics, and know, I

live this.. our existence is not scientifically
separate from the timeless nature of
consciousness, proven as not only theoretical,
but actual. That is a first step at developing
a REAL relationship with the living Universe
if you want to as like an artist does - that
TOO! can be just as thought static in it's
orderly constructions for Atheists. (An
Atheist is still mostly a fool here however.)
Overall, for any, it's sorta simple: Life has
left YOU in charge of YOUR fate. Now, do well
to make something of this being as eternal Life
reaching for balance, as your body does, and
good cops do when bringing the bushmobsters to
Justice. By Israeli calling for more murder
against the innocent of your mind as racists
and bigots they are openly, is still shadows
of YOUR mind, YOUR WORLD.. get it, got it? God
is in genius to set Life as this, as like,
nowhere existing, but for as yourself within.
Will you speak out for the Justice denied
Humanity?, or not you? Atheists can be Just
too!, but generally lose it on not
understanding the intelligence of order is
way beyond what they dream up with
assumptions. All anyone has to do is ask
themselves, who do you mean "God"? Atheists
are ridiculous!, but, to each his or her
own, we are on a path here, believe what
you want to believe. This is not a faith
initiative I'm bringing by keeping this real,
I DEMAND JUSTICE BY OUR WILL BE DONE.

A zionist cabal of criminal pirates who murder
Jews around the world for stolen money is
seriously evil as criminal. What do you think?
Let US have a open line discussion on this
indivisible matter of rights to all as equals
before who ever we proclaim, I AM.

I mean you right? Say it with me... "I" "AM"
we are good to go.

-

George Galloway "The West has DOUBLE STANDARDS when it comes to
Israel"
http://www.youtube.com/watch?v=IIpvrOJQ0J0&eurl=http://whatreallyhappened.com/

A Zionist Nazi Being

See? A zionist Nazi argues it's good to get killed
Jews by breaking truces with a prison death camp,
cause look at all the free American Welfare money
we can steal through kicking-back AIPAC members in
Congress.

-

Harper complicit in Israeli war crimes
http://onlinejournal.com/artman/publish/article_4246.shtml

Canadians! Please war with words for open line
calls on the war crime enemy propagandist,
The Chorus Radio Network. CJOB STEALS millions
from Manitoba each year, and refuses all calls
for honesty in governing. They are actual
CRIMINALS.

Canadians Stand Alone
http://www.thestar.com/article/569872

Harper the proven war criminal
who will be going to prison, is the only person
on Earth that has publicly okayed Israeli Nazi
to target murder Christian school girls. Canada,
join me in demanding Harper's Public trial as a
war criminal. Prison for Harper who took a
honorable soldier who stated he refused to commit
war crimes against innocent civilians, and placed
him without trial in prison. Without warrant for
arrest. Harper, the Nazi Appeaser, is a War
Criminal standing against the Queen.

"Or is this another, popular amerikan past time,
of, who cares for the facts, we are at war with
God and Christ now?" Die bushite die Christ always
says against lawless torturers as mass murdering
thieves of Humanity.

shreveport man gets 15 years for stealing $100.00
http://wesawthat.blogspot.com/2009/01/shreveport-man-gets-15-years-for.html

Again, Americans need to demand the arrest
of the Judge and prosecutor for being openly
evil demons, as TRUE enemies to freedom in
America. But guess what? Americans will refuse
to even phone Alex Jones, or George Noory
to be hung up on. Just refuse as brain dead
zombies - as known in this circle, McCainiacs.
Did you hear Alex's NWOer yesterday state he
doesn't want anyone to speak as Justice for
Americans because to learn even the most basic
of precepts for Justice, he can't pretend he is
a Freedom Fighter begging US for more money?

Like multi-millionaire Ron Paul, who gave the
fixed election up to take our money and walk
away. How much money in the millions do we have
to pay them at GCN, before they will acknowledge
the Iraq war is a war crime? THEY NEVER WILL,
because the owner has a son who's into
raping American women as lawless enemy of Life.
Americans are indeed, selfish, like all the plane
crash survivors telling US how they couldn't care
less that Israeli nazis are openly targeting our
Christian children for murder with their tax
money, as unimportant, to how long they stood on
a plane wing, now approaching it's third day, of
wall to wall coverage. Telling us again of how
Christ saved your life as a lifeless degenerate.
I, as Christ, am really starting to hate all
Americans in total now. How difficult is it to
pick up their phones? They don't, and I'm beginning
to believe it's because, like GCN, they really
don't care for the future of our Humanity being
left for dead as continuing victims to EVIL liars.

Nazi Israel Broke Ceasefire as Satanic:
The Bush Administration and The New York Times v. Amnesty
International
http://uruknet.info/?p=m50870&hd=&size=1&l=e

UN sites shelled with WPh after GPS coordinates given

Livini was reported to say today that, 'every
innocent person targeted by Israeli, as such
driving in ANY car, or on ANY bike, or walking
down the street as then directly murdered, Hamas
will be blamed for. Heil Hitler' Well, I made
that last part up, but do you have the ears to hear
the screams for mercy given by Humanity?, while
this, the evilest of JEW KILLERS in the known
universe, (targeted, and murdered countless Jews
in Lebanon as one example), believes no man or
woman living can speak directly against her wanting
to MURDER even more as ungodly... 'Until the tin
can rockets stop falling on Jews' standing in their
detention centers, or living at the garbage dump
BUT.... THEY BROKE THE TRUCE! THEY BROKE THE TRUCE.
They will rob and kill US all my INNOCENT friends
as LIAR Satanic if you, YES YOU continue to refuse
to support my/our demands for OPEN COMMUNICATIONS
for Justice ourselves. Johnny Dazzler for Coast
to Coast Radio Host!

'Secretary General outraged at shelling of UN building in Gaza'

"I conveyed my strong protest"

Not good enough. Public War crime charges warranting
Death by Jewish firing squad, is what is demanded of
our Humanity. Death to the zionists liar war criminal
enemies of Humanity, instead of US, who they target
for mass murder.

They are jewish criminals, not criminals because they are Jewish.

HERE IS WHAT GOOGLE IS:

"End the illegal Human occupation of Jewish land in Gaza!"
http://stoptheism.com/

HUMAN

These war criminals need to be arrested for Murdering
LIES against the lives of every innocent Christian
and Jew. Godless zionist nazi bastards are as evil
as they are dumb. Get every man who defends freedom
truly to hunt down these satanic demon ENEMIES for
thee True Jewish Cause, to ask it why it lies as an
enemy to HUMANITY, to murder innocent others as
evil doing thief to Freedom. A thief of Jews
everywhere to know truly God as Love and Justice.
Not only will Americans celebrate these neocon criminal's
freedom to call for the murder of innocent Christians,
as he does without arrest, "Americans" too, will as
Satanic refuse to hunt the ungodly enemy of the Jewish
faith down as Nazi hunters. No, Americans, cowardly, are
committed to dying with the Nazi Elite, as such
to escape of the Neocon terrorists who participated
in the mass murder of America for more stolen money
as war criminals.

THESE ARE SERIOUS WAR CRIMES

Israeli soldiers say they have OK to KILL Innocent People
http://www.mcclatchydc.com/251/story/59704.html

Israelis 'shot at fleeing Gazans'
http://news.bbc.co.uk/2/hi/middle_east/7828536.stm

They'll murder anyone human to steal our homes.

-

We battle injustice by demanding the public
arrest, and trial for execution of proven
war criminals. Now, who disagrees?

Israeli using Palestinian Kids as Human Shields

Israeli Soldiers using Palestinians as Human Shields
http://uk.youtube.com/watch?v=FjEd4hJNVCE

Why do you as an American, refuse to contribute
to Just cause?

These monster enemies of Hillel are inhuman
to their prisoners, prisoners who had their
homes stolen and are denied freedom for being
born to Nazi tyranny. Demand Justice for
yourself as a Human.

Some Serious Evil Jarg in Dishonest Reporting
http://www.aish.com/jewlariousMultiMedia/jewlariousMultiMediaDefault/Israel_Unfair_and_Unb
alanced.asp

Forgetting about the truce given to those in
a concentration prison camp? Where they are denied
food and water? In curfew prior to near half the
days of the year, for years? How could they not
to claim such self righteousness? They don't bother
because they'd rather YOU were made innocent victim,
then them, Zionists who would screw you out of a house
called home. Did you know: they openly steal Peoples
homes in that criminal nazi state labeled godly?
Of whom openly thieve? Officially? Yes, and they try
to thieve the title of Jew from the Messiah too,
but I'm not going to a slave prison death camp
for innocent humans, I'm fighting back to demand
open communications to rule true Justice concerned.
Freedom is paramount. 911 perpetrators will be
brought to Justice by King of Jews Johnny Dazzler.

-

Israeli Murders Officer to make it look better

israel-fakes-rocket-fire-fatalities-in
http://stevenwarran.blogspot.com/2009/01/israel-fakes-rocket-fire-fatalities-in.html

/ / And we may assume that he was a non-Jewish
member of the IDF, given [...] \ \

Lawless evil doing for neocon lying criminals
really sucks man. Our friends are dying murder
victims. They are robbing our humanity of common
decency.

Neocon Enemies of the Jew do not Care for Truth

ElBaradei says Iranï¿½s nuclear program is legal: report
http://www.tehrantimes.com/index_View.asp?code=184534

But Neocon enemies of the Jew do not care for Truth.
They lie as enemies to God, on hopes to murder Jews

like they did in Lebanon with millions of land mines.
What kind of "Human" would commit such crimes against
Life? Cheating Liars for Satan Johnny tells YOU.

When Bush asked about his errors in judgement:

/ / you know, could I have done something
differently, like land Air Force One
either in New Orleans or Baton Rouge. \ \

Would have been better PR he means? Likely.
He walks away looking good, your family is
dead, or dying due to criminal neglect for
cash profit. Did I tell you that the private
bankers don't even cover our loans yet?
Trillions given by Americans, now Obama is
asking for more to disappear. THEY DON'T
even tell US what they've done with the
eight trillion already taken. Desperately,
Life Begs, THINK ABOUT THAT. King Johnny
for Coast to Coast radio host.

/ / So what is Ron Paul saying about Ron Paul?
I'd wager, he doesn't know himself, and fears
like FOXNEWS from open debate \ \

Excellent! if I do say so myself.

-

The Queen Shall side with The Great Nation

You can not hand over a prisoner for the crime
of refusing to commit a war crime. Otherwise,
YOU'D be a war criminal like now Harper is.
A Zionist appeaser. The government of Canada
already decided on this issue, and the vote was
137 Patriot to 110 neoconned bushite dumfuk.
The Iraq War is a war crime. These be demons
that steal our democratic voices, by denying
freedom from a man who's capital offense, is
that he tried to be fair for all parties. See?
War criminals.

The Queen Shall side with The Great Nation of
Canada Vs. S. Harper on this. Ask her.

God Bless the Queen.

-

/ / destroying Hamas terror infrastructure \ \

As Satanic, they TARGET TO MURDER Christian
School girls, and claim, none on Earth will demand
their public trials for executions as War Crimes
against God, because to the Satanist LIAR, (and
many "American" "Christians") God doesn't exist
within YOU to demand Justice for our Times.
YOU change that.

Evil on Parade

43,000 FoxNews Zionists in America, sign petition
in YOUR INNOCENT BLOOD calling for censorship of
Gaza conflict across all America

http://www.iraq-war.ru/article/186735

Stressing that Israel was "the first to stand
up against pure evil." [See? A zionist Nazi argues
it's good to get killed Jews by breaking truces
with a prison death camp, cause look at all the
free American Welfare money we can steal through
kicking-back AIPAC members in Congress.]

"I demand that the use of images and headlines
that misrepresent current events to the detriment
of the State of Israel be stopped immediately,"
the petition went on. [and the 'judge' judges
anything detrimental misrepresents the constant
LYING nature of the Nazi Zionist thieving pirates
of the Jewish Faith?]

This is detrimental to Zionist war criminals
because it exposes their TRUE EVIL NATURE..

Israeli Forced to Admit in League with Satan
http://uk.youtube.com/watch?v=zfFMZ7Y-s_c

Israeli forced to admitting, it lied as a demon
enemy of Life about tin can rockets falling
into the head of a good Jew, prior to the
Neocon LIAR's ungodly criminal attack for
senseless war against Humanity in the region.
When Jews die, these Zionists really take
everything like bandits., Peace where smarter
People speak freely for Justice? not so good.

The Other Side of the Story!

I Want My Bailout Money by Michael Adams the Health Ranger
http://www.youtube.com/watch?v=dnT21hmlT4o

Breakdown Dead Ahead
http://www.youtube.com/watch?v=yFCnVC2C8As&feature=related

-

Simple Common Sense for Mankind

/ / Israel has admitted HAMAS kept the cease
fire; and that Israel broke it, then unleashed a
total starvation blockade on Gaza followed by
flaming death from the sky aimed at schools,
hospitals, ambulances, and children, and you
dare call the people opposed to such barbarity
a "mob?" \ \

Zionists are evil people who pretend they
are honest, when lying directly to everyone.
Blitzer reports Hammas broke the truce, he
is lying to continue the murder of innocent
peoples. Understand: Israeli Nazi state they
will continue to murder our innocent Humanity
until the rockets stop falling on Jews. Yet,
they broke the truce, and murder Jews routinely
with reckless abandon. Jews from the Bible as
of "nigger" Ethiopian, are what the Zionist
hate when warring GOD for apartheid, apartheid
that is Humanity in Gaza. A zionist is a war
criminal who speaks not against the neocon,
but against Innocent Humanity as YOUR enemy.

Livni: Gaza truce would give Hamas legitimacy

As they always do because they are dishonorable
murderous nazi thieves of God as Just cause is.
I am, and YOU are, you just maybe don't know it
yet, or if ever. A zionist serves Satan to escape
the neocon terrorists from their ungodly crimes
on 911.

http://desertpeace.wordpress.com/2009/01/12/gazatoon-of-the-day-blaming-the-victim/

Ron Paul:
US Will Be Rightly Blamed for Israeli Killings
http://www.youtube.com/watch?v=6C756NOPyDA

Not the Nazi Israeli?

The guilty party are those who advocate these
mass murderers of innocent peoples with
deliberate lies, like from Blitzer. Blitzer
will be tried, and executed a war criminal
for stating Hamas broke the truce., Where,
only two minutes earlier, he learned, that
it was his Nazi partners. DEATH SENTENCE.

It was on TV. BUT SEE? Ron Paul, the Libertarian,
ain't going to be honest here. He'll lie cheat
and steal Humanity's voice for Justice - like
he did with OUR money. A typical Libertarian
like Alex Jones who wants to blame "socialists",
"Liberals", aka, all of innocent America.
Blitzer is war criminal, who makes his own
discussions. As is Ron. What an enemy to not
mention the truce. THINK: IT IS THE ISSUE. But
Ron plays the dummy to kill more with contempt
for Freedom. Ron Paul, the bigot, asked,
'should we be doing this'? SEE? it's not first
degree mass murders, no, according to Ron Paul,
it's argumentative that indiscriminate mass
killing is a good thing really. Remember,
Ron Paul does not support arresting those
who committed mass murder on 911 either.
Or those who STOLE TRILLIONS. Or lawless Bush,
the ACTUAL AntiChrist enemy of God. Ron Paul
will watch America die for a stolen dollar.
And Alex Jones will refuse all calls to label
him good guy like himself warring order
to our universe for it.

Israel is [NOT?] responsible for these childrens death
http://uk.youtube.com/watch?v=Y9PIZQqIep4&feature=email

Ron Paul "When we pick sides, we make it worse"

He also took our millions donated for freedom
fighting away for his family, but not our own
as dying innocent victims giving. Pick a side.

-

Contribute to our rise for the popular will

Alex Thomson shuts-up Israeli spokesman!
http://uk.youtube.com/watch?v=zIQZ1-RFq6A

Wow. The demon LIAR will also say Hammas broke
the truce, and Israeli started this by stealing
innocent peoples homes, then imprisoning
ourselves, the victims, in a death camp for
indiscriminate slaughter. While they STEAL OUR
CHARITY. What is it that YOU can't picture?

Hi. My name is King Johnny.

TALK IN AMERICA
http://www.mediafire.com/?mxw3nzi4nzf

-

/ / The targeting of civilians, whether
by Hamas or Israel, is a war crime. \ \

They are targeted by Obama who suggests
there is an argument to be made here. There
isn't. Nazi Israeli DEMON LIARS broke the
truce to kill Jews for money. They are godless
enemies of Humanity. So it isn't that we are
pro-Palestinian, it is that we are pro-Human.
Zionists DESERVE to die, before US, the innocent,
they target for murder for stolen cash gain.
Like Obama has promised to do for AIPAC. But
what about the rest of US 6 billion plus Obama?
Who is it of US innocent folks do you wish to
MURDER, or torture next as a Zionist war criminal
for Satan Obama? Torturing kids is popular in
Israel, tell US Obama, which American father will
have his children tortured, or murdered
sadistically by yourself as a whore for Nazi
Israeli? tell us, we're not waiting.

The Chosen Bad Example

Zionists Destroy Our Homes as Satanic
http://www.youtube.com/watch?v=mo2HW4T7wK4&feature=related

When I see the women and her child, left outside
while they sadistically destroy her meager gains,
I grow weary with ourselves for not speaking right.
Nazi Israeli are committed to deny US our God given
rights as Innocent persons to speak freely for Justice
realized. All because they STEAL our Lives for monetary
gain. It is our reality, give it or take it, YOU LOSE.

Then.. Hammurabi founded Civilization.

I go concerned for any hesitations of condemnation by
Obama. It's like, he's talking some jive about
how now he'll NOT let the words of Hamas reach
his ears. Being against war criminals, doesn't make
you pro-Hamas, necessarily, it means your against
war crimes to defend the lives of ourselves respected.

We are Good to Go. Rise Up for innocent Life,
or don't and see where it'll get you in the end.

TALK IN AMERICA
http://www.mediafire.com/?mxw3nzi4nzf

Nazi Israeli STEAL Peoples Homes without
apology, as a function of their SATANIC
government, while collectively bombing the
INNOCENT victims who die because of it.

Gaza 2009 - Operation Cast Lead
http://www.youtube.com/watch?v=hFEiOfLUfzY

Again, they are Satanic here because
they THREAT to tell you, yeah, Zionists
are casting the leads for the real mass
murder scenes - Justice denied Humanity.
God doesn't exist to defend yourselves
from war criminals for Satan.

War crimes trials with public executions
will commence against ever GUILTY zionist
living to lie that Hamas broke the truce,
that Georgia was attacked without provocation,
(again, CNN are not 'accidentally' conning
US here). And trials for every last living
bushite bomber, rapist, and torturer -
death to the bushite, the true traitors who
war against freedom for America, traitors who
war Innocent Humanity for the escape of the
neocon zionists.

-

Both parties cheerlead loudly for Israel's war Against Humanity
http://www.salon.com/opinion/greenwald/2009/01/08/israel/index.html

Death sentences MUST be willed by Christians for war crimes.
Death to the bushite, death to the enemies of God and Man.

-

For the Great Truths. We Stand United

/ / This option is also regarded
as a non-runner as the US would certainly veto that
suggestion. \ \

No no no no. What you do is investigate who this
the "US" person is as the GUILTY party my friends.
The facts have spoken for ourselves without contention.
And while we're at it, try to figure who that "Army
says.." person is too, we need to know who these
traitors are who hide their names backing war crimes
to continue. The Enemies of Civility, they are
enemies of US all my innocent friends, enemies of US
all.

-

Here on a Mission

/ / after dropping leaflets warning residents it was
about to "escalate" its offensive against Hamas. \ \

SEE! This is AFTER fire bombing the whole community.
Satanic evil enemies of Life. Who admit to targeting
any one who has ever so much as swept our streets,
warranting bombs dropped on their Block(s). SEE! they
are ENEMIES OF EVERYONE. EVERY LAST ONE OF US.
INCLUDING GOD.

It's a prison death camp, brought about by Israeli STEALING
OUR Homes as ungodly thieves. Thieves who leave a Jew
to starve to death in a garbage dump because, it'll
attract more charitable aid The Zionist can use
elsewhere. It's not a Jewish thing, it's a criminal
matter. They STEAL innocent Peoples Homes in that
country. God's Country? God would will such criminal
offense? Which God? Not the God of Abraham, nor by
the teachings of Hillel, Christ, Mohammad, or
Confusion? So which absent God do you speak where WE
can't speak as ourselves openly for Just Cause?
Cat got your tongue? How come your not saying anything?
The Israeli Zionist ENEMY wants US ALL in slave
labor prison death camps silenced away that's why!

Israeli War Crimes
http://bothwell.typepad.com/whos_your_nanny/2009/01/israeli-war-crimes.html

Well, maybe I'm wronger on Ron Paul than I needed to.
Hey, don't you EVER forget, I am a man also. We need
to meet on common grounds, to demand the start of
formal arrests for the bushmob crimes of 911, Iraq,
Afghanistan, South Osettia, and Palestine, as a group
together united by agreement for this one cause, and
then... we can later argue about how your ideas are
better than mine because I actually know of which
your speaking.. Hey! you could call me Daddio if you
wanted! To the telephones we go.

-

Israeli are attacking prisoners held criminally
in their own Death Camps!! GET ALEX JONES ON THIS!

Hmm... why wouldn't Alex? to support his fictions
over Our Rights to Live Free perhaps? A Hero adapting
to the deaths scene?, or, a Bush whore committed to
enslaving Humanity, all so he can say, he told US so.
Big hero or big hero. Your NOT powerless to his vision
of complete control over information. He refuses 911
info, Iraq war info, Israeli info. All so he doesn't
have to look the fool, while Humanity dies with his
insults against our wills to make something better
of ourselves. Justice is what I will. Masturbate on
your own time Mr. Alex Jones.

If he states again about how he knows everything,
and is always right, and those that criticize
him on ANYTHING are delusional, it's going about to
make everyone further sick with this obscene take on
what life means as Alex takes it. If I truly state
two nickels make a dime, does that mean therefor
they make a quarter also? If I say so like Alex
would? He is an idiot. Truly. George Noory figures
Hamas broke the truce, and that the Mideast solution
is that Jews should be separated with special rights,
as oppressors over the freedom of every Palestinian
Prisoner, and what's Alex Jones gonna say about
his 'truth telling freedom fighter' George to actual
'lame ass evil nazi traitor' George?, to YOU about
how George is just trying to murder millions of
helpless people as an offer for the final solution?
We can expect Alex now to claim, Zionists should
have special rights over Jews, all to maintain
his FICTIONS on Noory being anything but the
monster to Humanity he is. Just because Noory
doesn't growl when talking about murdering all
children in around the age of 15, or against
soldiers who refuse criminal orders, does still
make him a true fascist nazi enemy laughing at
your murderers escaping to live freedom in
our dying forsaken worlds. The bushmob doctored
the NIE. Conned Congress, and Soldiers. Did 911,
by closing criminal FBI investigations immediately.
Alex and George don't seem to want US to know
these FACTS that demands arrests of the culprits
responsible for high treason against Johnny's
America. Now, who's with yourself. I am! I am!
I am!

Alex Jones doesn't know squat of Social Security, but
pretends he does, like Ron Paul does when speaking
of the Federal Reserve, Health Care, IMF, World Bank
blahblahblah.. I mean even the expert of experts
Alex has on near twice a week, EVERY WEEK, to talk
all about how the Illuminati are doing everything,(give
me your money now for whatever), DOESN'T SAY TO KNOW,
it was Chris Cox who changed Investment Banker rules,
to cover instead one tenth of WORLD INCOME loans,
to one twentieth. MORE THAN DOUBLING THE ENTIRE GLOBAL
MARKET FOR LOOTING WITH HIS SIGNATURE! (And. that isn't
even a fifth of the TRUE trillions dollar fraud story.!)
Now, granted, I wouldn't expect one tenth of one percent
of America to have even a distant clue of which I am
speaking, but importantly, Alex's expert of experts has
never mentioned it. EVER. Why? He don't give a fuck, but
how much money he can get you to give him for investing

in things that are un-important to our struggles, but for the fact, he states, you'll get free money for nothing!! OUR ACTUAL PROBLEM. It reminds me of those Ron Paul dollars... where Ron'll fix everything, cause we, as a private company, are going to make YOUR money instead... holy fuk mon.. Talk about the kettle calling American racists. Thank God the FBI stepped in. (The answer unfortunately is not nowhere as easy as Alex would blindly lead you) - again, so I guess it will be, Americans were just too far gone as illiterate chauvinists, who cared too little for your freedom as themselves degenerating. Why? To battle tyranny they knew not Justice wins the day, and blamed innocent groups gathered wherever, instead of following the crime scene leads at the real murder scenes - like was once done on TV and at the Movies. But even that was too far above their doped down heads, to raise their finger to dial a phone number.

The head of GCN has a son warring God to rape American women as lawless enemy in Iraq for the Neocon - again NEVER mentioned as something worth fighting against for Freedom in America - soldiers are suppose to REFUSE criminal orders - but not when Alex is at the mike. He will never mention the Bushmob doctoring the NIE to con America for death as exampled, because it doesn't fit his fictions, where all the bad guys escape because they are geniuses headed by secrets so powerful, nobody can ever know'em, except Alex. He tells us near every day, he knows everything already, and is never wrong, therefore you can't criticize him. Bullshit. It's like he wants to be wise like Johnny Gawd is, without doing anything like studying for a test where the teacher actually does know the issues. He told US today, the British came up with concentration camps, from the Indians - who spent all their lives murdering themselves. The British 'invented' false imprisonment? The British came up with the, Jews Killed Jesus? The British invented Pope Gregory VII? I suppose Alex has never heard of Ghettos. SEE? he just pulls shit out of his ass, and calls it like it's truly pure gold you'd wanna buy. Those, like your typical American have no clues, so they figure, Life must be sorta so that History is all one big Alex Jones NWO cartoon. What? that the NWO did 911, and everything else that use to instead, require criminal investigations to nab the actual evil doers? Alex Jones IS the NWO he tells US all we should be concerned about never stopping, like it was in the DARK AGES. Justice Alex, why is

that hard for you as a "Conservative" to figure? Is
it because you are cowardly in the face of true
Liberty? Afraid that some People, on some Issues,
ACTUALLY know a great deal better than you could
even imagine presently? Don't like that do you?, where
you don't rule this Universe as a lawless tyrant
desperate to live in an illusion at the expense of
everyone else dying victims to censorship? Does he try
to find wise men or women? rarely. "Ron Paul [MUST]
leads our truth movement" - like, fuck off already
with the Ron Paul, The Truther, Bullshit Alex Jones.
1% is what YOU get on Social Security deposits - 1%.
And.. Bush stole 700 billion. 700. Billion. That's 700
BILLION. It's a "Trust" account. A "Trust" Account. It's
being held in "Trust" Alex. Ron Paul is asleep at the
wheel. As, so are the rest of all you other fools..
I want Justice, and I want it now for all the victims
of 911. Americans be damned, we want Justice, and We
want it Now.

Again, the two Laws of Johnny:

1. No evidence, person innocent.

2. Torture? fuk you and die then

"Rice says it is 'hard' for Israel to spare civilians in Gaza"

We KNOW they are ONLY targeting innocent People,
the ungodly zionist Satanic enemies say so..

"Israel Rejected Hamas Cease-Fire Offer in December"

Livni has declared her country "is not going to show restraint"

"Her" country?

It's like she's admitting here, that they DO NOT
target the IDF's Hamas, but only our innocent lives
as a threat to LIFE and GOD. Remember: the Zionist
LIARS broke the truce.

' In Civil-Contempt Cases, Jail Time Can
Stretch On for Years for Americans, without Ever
seeing a day in Court. '

Where are the arrests?, then firing squads for
the Judges who 'judged' such criminality against
freedom for US, the Peoples in America?

' Where Did Taxpayer Money Go? Panel Slams Treasury
[FOR STILL REFUSING TO SAY] '

Where are the arrests?, they stole eight trillion
and counting.. And Congress 'slams' them for
disappearing OUR MONEY. Slams with what?, a,
don't do that again please butt sqeeze? It should
be massive slammer time, with a return of all
STOLEN monies.

' THEREFORE, those pro-Israel politicians in Congress
won their seats in part using stolen money. '

Where are the arrests? Amerikan bushite nazi grunts
are assisting in the mass murder of innocent Christians
in Palestine. War crimes demanding death sentences. It
isn't an argument that can be turned around. Nazi Israeli
STEAL Peoples Homes without apology, as a function of
their SATANIC government, while colectively bombing the
INNOCENT victims who die because of it. It's a prison
camp! they are denied water, food, shelter.. since four
or five truces over that they've broken, every one. These
are Satanic enemies, willing War Crimes against God,
a God NOT loved by zionist American Nazis. And a Son
as powerful as the four winds, ridiculed by Zionists,
and American know nothings, for the continued debasement
of YOUR soul worth here dying.

Israel Attacks Iran News Station

Why does not Iran DEMAND arrests, and death sentences
for these blatant war crimes against Humanity committed
by Amerikan Nazi Israeli Zionists? Along with the
perpetrators of 911? WHYWHYWHYWHY. Russians! Can you
help US out?

-

THE NAZIS SHELLED THE HOUSE WHERE THEY HELD
INNOCENT CHRISTIAN PRISONERS
http://uruknet.info/?p=m50596&hd=&size=1&l=e

Rise up for Justice American Christian, or
die innocent victim the Son of God does say.

-

Pictures of Alex Jones masturbating
"we were right about it all."

George Noory tells us openly, he's
into killing innocent kids for profit.

Traitors to the Cause

Bush and Cheney are traitors to the cause of
American Liberty. To leave them free, is to leave
America un-guarded from further transgression.

UN: Israel Admits Claims About Attacked School Baseless

US military re-supplying Israel with ammunition through Greece

/ / UN Call for investigation into shelling of
Civilian shelter \ \

Investigate that evil does exist in the thieving
LIAR name of godless Zionism? The enemies of God
and Jews everywhere?

-

Freedom Granted by Americans for Neocon Liberators

"Americans are having their heads velcroed to chairs
and forced to take in nutritional supplements by a
tube forcibly inserted through their noses by US guards."

These are People not charged with any criminal
offense don't forget. Die bushite die you know is
what I recommend, as does Reagan. A dead bushite
means you've saved the life of their next victim,
an Innocent Human Being guilty of no crimes. The
war criminal enemy is the bushite, the Zionist,
the LIAR neocon traitor to Life as this Universe,
along with every dumfuk grunt who serves tyranny
for the bushmob at Guantanamo, Iraq, or Afghanistan.
It is a soldier's oath to obey lawful orders only,
but Cheney they don't take out with American Law -
how come? cowardly fascist nazi whores for Zionism's
evil as the ungodly that's why. Cowards dying for
the escape of the Neocons from the 911 scene as
reported publicly. - Vs. US. That's we whoever
you are.

Widespread Suffering and Death
http://www.youtube.com/watch?v=gVdee2iXSVk&feature=related

Notice no one shoots at the blimp fire bombing the
entire neighborhoods. And if it's phosphorous, that
smoke is already deadly toxic. That is why it warrants
the Death Sentence under International Law when used
against OUR Humanity, as the most evil of Nazi War
Crimes ever. The neoCON LIARS are the LIARS conning
you here on our TVs and Radio dramas, in where, they
don't want to openly take our public calls for real
Justice. Bush and Cheney are traitors to the cause of
American Liberty. To leave them free, is to leave
America un-guarded from further transgression. So,
them being "puppets" is even all the reason more to
insist in their capture for trial by Jury. A Public
Jury of our Peers. Now, who's in with You? You can
count me in. and I bet willed to action, we will find

others to be something of ourselves too.. Justice
and Liberty for All. Equal rights given is what true
freedom is as measured. Translated from the 'Alien'
dialectic to Amereeze jank vibe; where is the fucking
evidence here Neocon traitors who false accuse to lead
us off the straight and narrow? It leads to Bush,
Cheney, Rumsfeld, and Condi that's why I figure, you
figure, they figure, we figure, so... what are WE
going to do about this sacrificing for godless tyranny
further then as unrepresented?

Israel Attacks Jews,
Silence from Mainstream about Violation of Law
http://www.youtube.com/watch?v=K1kt8qi0M-M

They kill Jews for money. They bombed Jews in Lebanon
for money. They want to bomb the HUGE sacred Jewish
communities in Iran.. wonder why? Zionists are not
Jews, for Jews don't steal in God's good name. Nor
target innocent beings for stolen gains. A zionist is
a thief to life, and as such, needs to be formally
charged for their criminal offenses, given lawyers,
and upon a successful prosecution, rot in a prison
cell and/or pay restitutions. YES. why? so not another
innocent person must fall in their place as next
victim to a zionist's public commitment to lawless
tyranny for evil intentions.

Johnny for Coast to Coast Radio Host

The Appropriate Response To Islamic Terror
http://revisionistreview.blogspot.com/2008/12/judaic-columnist-urges-kill-muslims.html

/ / an Orthodox Jewish Russian immigrant \ \

Let US never forget, the Zionists also would bomb
some locations, then later, drop the warnings
for the Jews to run for their lives. Didn't warn
them though if they get into a car or truck they would
be destroyed instantly by the Zionist flying the
America paid for Apache. I did a big show of shows
through that continued as, more 'un-resolved' crime
scenes perpetrated by the treasonous, neocon Zionist
terror merchants. It's like they think some dying
fools are going to keep going to save'em in the end
from ourselves as still suffering in Justice denied
as enslaving into ungodly tyranny eh? These Zionists
are not only the bad guys, but they're bad guys to
even the bad guys as there is no found honor among
murderous thieves. A Zionist will kill a Zionist for
a stolen nickel, as do bushites today. Hey! it's only
Your Life in the balance. Or are you one of those
who goes in America, it's okay, we're only murdering
innocent folks who don't live in Israel.

Doing what's right and just, or evil as dumb is
Your riddle. Get back to US on that.

We need People are Equals Power!

President and CEO of Shareware Earth Co.
King Johnny Wizard at your service me Lord.

-

/ / It is just unacceptable to apply two standards of morality, one for Jews and another for non-Jews. For if what Israel is doing in Gaza is right, as Israel and her supporters maintain, then what the Nazis did in Europe several decades ago must have been right as well. And vice versa. \ \

The ungodly zionist enemies, are enemies of God and Man. Don't think the NAZI Zionist like Bolton doesn't know this, with his friends at FoxNews.They WANT to rape, murder, and pillage America all her freedoms for the bounties of private banker frauds. The banker does not ever cover our loans, we do. So, why give them trillions of American worker waged dollars for nothing?. THEY DON'T COVER LOANS. See? that is what this war against God is all about. People of Humanity just seem to truly hate a guy like US as wise and Just. See, people hate US, because they can't for their lives disagree with Facts. Why won't YOU support these same rights and champion our demands for open communications. Johnny for Coast to Coast radio host.

US Again Stops UN Call for Gaza Truce

Who is this the "US" person?, and let's put him to death with Bolton and Kalilazad for the most serious of war crimes against OUR Humanity. Remember, Bolton was NEVER confirmed because, the Zionist could find no man or woman to say a single kind thing about him. FACT.

CNN: The Nazis Broke The Ceasefire!
http://www.youtube.com/watch?v=KntmpoRXFX4

Protest pictures from around the world (not on CNN)
http://www.rys2sense.com/anti-neocons/viewtopic.php?f=11&t=16496&start=0

Remember Israeli nazis to this day, insist as DEMONIC LIARS, Hamas broke the truce - as Hamas is responsible when they target school girls for slaughter. They said the UN were secretly attacking Jews, clearly a LIE as impossible to prove because it didn't happen. But facts are the furthest thing away from the godless false accuser Zionist con man or demon witch LIAR like Livini. FoxNews calls the demon witch a Jew! ANTISEMITES.

We can witness, Americans do not have the intellect to understand what this means. See, LIAR Nazi Israeli broke the truce to get killed Jews for money. A

regular fair for Nazi Israeli. Now, they state they
will continue to indiscriminately murder humanity
until the tin can rockets that travel miles stop
killing Jews who hate Zionists. But importantly,
it is Israel that wants Jews to die, so they can
make off as Satanic with our stolen values. Just
like the Bush family did with Hitler, that the
Nazi Nation has no probs working gun in hand to
wipe out Jews everywhere still to this day. Again,
Nazi Israeli MURDERED JEWS in Lebanon as targeted.
And leave Jews to starve to Death in Israel for
more charitable aid they can use elsewhere. Public
knowledge not disputed by any living soul on this
planet because, the Zionist government admits freely
to this. Israeli think being Satanic is worth it,
for all the money and lives they can steal as enemies
to Christ, Hillel, Mohammad, YOU, blahblahblah.

http://www.liveleak.com/view?i=ab0_1231290043

http://www.kuwaittimes.net/upload/img_pict/headline9637e7.jpg

Read of the bushite in my America who call this work
of Satanic enemies, a good thing they support to
war terrorism for the sadistically evil liars of the
neocon. Then KNOW my friends, a bushite is the enemy
of every living soul on this planet. Have no love for
those in the Air Force, the enemies of Man who bomb
our families without excuse, but to know, they hate
US as Christ to speak free for Humanity. That DEMON
George Noory was so happy last night about all the
good the bankers AND CHENEY are doing for their hatred
they spoke of for all Russians. SEE? not to protect
America, but to kill you with their true commitment
to the demonization of innocent people, all to escape
the neocon terrorists. I HATE George Noory more than
anyone alive in America. He is so openly evil to ourselves,
that only those who wished to lie to you, (like Alex
Jones does about Ron Paul), would say otherwise as
bushite dumfuk enemies. Cowards committed to escaping
Bush and Cheney for treason against Freedom. They
doctored the NIE on Iraq, highest of war criminality.
Alex Jones has never mentioned it, but for MAYBE in
passing. Hey because all the bad guys are just puppets
to ignore over the elites, globalists, socialists,
liberals, gays maybe, Blacks, Mexicans, and anybody
else smarter than NWOer Alex. Ron Paul is a coward as
rarely if never has a clue of which he is speaking on.

Israeli PM says to end offensive if Gaza ends rocket attacks

Sarkozy urges Syria to press Hamas for Gaza truce

How does the ungodly get away with this obscenity? Nobody can deny Nazi Israeli broke the truce, as they always have done as Satanic for the last 60 years. Killing Jews for money is popular with the Zionist Nazis don't you know us by now? FoxNews CONNED Americans for DEATH with the unmentioned, TREASONOUS doctoring of the NIE. To kill Americans for more neocon gains, which Alex Jones never mentions either. Do Americans even care enough to raise Humanity's call? Do they demand public executions of sadistic godless Zionist torturers? as the Standing Law of America - The War Crimes Act - brought to be by Reagan - DEMANDS by the Law of America? It is the Law after all, yet, CNN, CBC, and FoxNews calls the perpetrators of the most heinous evil against Mankind, heroes. America is
a nation of godless cowards willing to die murdering innocent Christians in Israel, all for the profits of the 'magical' zionistic private bankers. Bushite grunts are now supporting the indiscriminate carnage, serving as police services forbidding any of the prisoners in Gaza from fleeing the indiscriminate slaughter. Again, as Satanic, they don't arrest the "Suspects", for what could they truly charge them with?, no instead demand we die helpless murder victims by forbidding escape, as they did in Fallujah murdering more than three hundred thousand innocent souls. Die bushite die screams to all men on Earth from the Son of God. Will you stand for YOUR life as truly worth something here? Like lawless enemies Policing your reality will bring you more happiness and prosperity with the great truth teller HAPPY George Noory? The demon who openly confesses the will to want to murder all children in around the age of 15? Too crazy for you to face such an enemy of huge demonic origin, so, go the cowardly way like Alex Jones as sell out slave instead, to cover the demon with endless praise on his treachery to not have our fight on everyday with open calls for understanding Justice is freedom. Instead of a constant stream of bushite dumfuk enemies of Living. This isn't complicated. Or it doesn't have to be.

Israeli nazis state they will murder humanity indiscriminately until rockets stop falling on their country. Yet, they broke the truce.

Alex Jones told US as a deceiver, he's been on Coast to Coast a hundred times. Not in these last eight years he hasn't. I demand Alex prove this, or be known by all far and wide a treasonous liar, trying to take US off the tracking of

criminal action of his buddy, the demonic enemy
LIAR George Noory. bin Laden didn't do 911,
despite the facts that WE KNOW George Noory
knows better of but LIES to con the American
teen further for death at the profits of the
un-elected bushmob. See Alex wants you to blame
anyone but those directly involved in the crimes
of 911, or Iraq, or those responsible for it's
cover-up by Zionist propaganda. George Noory will
have as invited guests whos only function there
is to spread dis info as supporting more
indiscriminate warfare for the escape of the
neocon terrorists responsible for starting the
illegal wars to begin US at. Or those whom often
support torture, a war crime that only exists as
irrationally held by those who's minds have only
a blind hate for the indivisible rights of
another innocent other. And often truly hate men
and women for being Just as wise. The McCainiac
Zombie video is a perfect example. When the Zombie
is asked about the rights of Women, the McCainiac
Zombie cried out for raping more Women. The
position of authoritarian power, was only found
with the bushite as oppressor, rapist, torturer,
or Air Force Bomber, not liberation by freedom.
The bushite McCainiac KNOWS it can't compete
openly to defend it's criminal treasonous
actions! Remember, Alex "the Conservative"
thought McCain was the choice if you had to make
one, earlier on, then changed his position,
sort of, later by calling them all puppets not
worth the effort, but .. Obama's idea's matter
not, it's that his Birth Certificate is, no war
too be fawned. Palin? who's she? McCain
firebombed Vietnam as "war hero" for France?
The Banker doesn't cover our loans? Matters
little.

Norwegian doctor: Israel intentionally targeting civilians
http://rawstory.com/news/2008/Norwegian_doctor_in_Gaza_Israel_targeting_0105.html

"All that is happening in Gaza here now is against
international law, it is against humanity and I
think it is against what it means to be a decent
person. You don't treat other people like this.
Even if you disagree with himï¿½ maybe even if you
fight with them, you don't treat civilians, children
and women like this."

Israel deliberately targeting civilians in Gaza
http://www.youtube.com/watch?v=Ev6ojm62qwA

It was almost acknowledged on CBC radio that
nazi Israelis, use the argument that a tin can
rocket traveled miles, to kill some innocent
Jew as a direct hit (likely a person who hated
godless NEOCON), all because that nazi state
has OPENLY, as PUBLIC policy, stolen water and
food including baby formula, along with a huge
list of other atrocities, to punish God and
Humanity since way back before three of four
truces. AGAIN, Nazi Israeli always, as ungodly,
break their truces. Why? Because YOU, or Christ
as any Jew's life means nothing, to all the
'free' billions they'll get from given American
worker wages. Look, Americans refuse to call
for the arrest of Bush on their national,
"truth telling" Coast to Coast radio program.
Why? Because, for one, George Noory, (Alex
Jones' best buds), has told US he's into
killing innocent kids as powerful, and that
'bin Laden did it', Is good enough for US.
You don't get a say here however how you will
live or die. George Noory calls all grunts
heroes, and those who refuse criminal orders,
those he wishes to go ballistic on. Yes, it's
true, George Noory is still alive and happy
as ever.

Rise Up for innocent Life, or don't and see
where it'll get you in the end.

Stealing the Title of Jew from Christ:

Fallujah by the Sea: Aping America, Israel Unleashes Chemical Weapons
in Gaza
http://uruknet.info/?p=m50412&hd=&size=1&l=e

Look at this picture of nazis indiscriminately slaughtering
our Humanity, while on MSNBC they reported that the Nazis
will continue to murder Humanity until a truce can be found,
A truce that the Satanic enemies of God will naturally break,
as they ALWAYS do. They are godless enemies of Life who wish
to steal the Title of Jew from Christ. They targeted Jews in
Lebanon with seven million land mines, and let Jews starve to
death in Israel for more charitable aid they can steal from
G-d's Good Will. When asked by Israeli newspapers why, it was
said to kill a Jew is rewarding for the godless Zionist.
Public record. Die bushite die.

http://lataan.blogspot.com/2009/01/israeli-zionists-guilty-of-deliberately.html

/ / In doing so, this makes Israel guilty of using
its own people as ï¿½victimsï¿½ for political purposes. \ \

http://www.youtube.com/watch?v=KUfgULhac8c

ISRAEL BROKE THE TRUCE - ISRAEL BROKE THE TRUCE

-

a-mother-from-gaza.blogspot.com

This web site is the winner of greatest interest
internet site of the years 2000s.

Israeli plan to topple Hamas, re-instate Abbas
http://a-mother-from-gaza.blogspot.com/

/ / Breaking the truce Nov. 4, then, was Israel's
way of getting the gears rolling for this whole
sick game: the toppling of Hamas, and the
re-instating of the impotent Abbas into Gaza
so the "peace process" can remain forever in
formaldehyde, to quote wiseass, er., Weisglass. \ \

Nov 4th! - perfect!. We are dealing with Nazi war
criminals who refuse US, as a Species, Justice
for everyone. Especially The Jew's Jew, Johnny
America. Hint: they call us Love just to hide our
complete agreement with this Living Universe to

will Justice for God as every last bushite zionist
freely moving. Once all the neocon zionists are
rotting in a prison cell, or formally executed as
godless war criminals, we all will have one joyous
welcome in a heavenly future.. Until then, demand
Justice for US. That's YOU too. Angels included.
Who? I don't see no Johnny Wizard here anywhere,
We are Good to Go. Rise Up for innocent Life,
or don't and see where it'll get you in the end.
The bushmob are traitors for closing official FBI
investigations into 911, immediately after the mass
murder of Americans occurred. Treason, of a, trust
WE don't have it in US to stand for our common
values as the Revolution will not be televised,
Johnny Who. Man, are we or no? Be Somebody, then
get on your phone to call in for Justice willed.
Alive I Say! - this must be where you'd raise the
dead and dying.. if you only could raise your finger
to dial the phone numbers - well guess what? - I Command
You Can! - snapoutofit - Speak for pursuing Justice
on 911, and show serious concern for publicly paying
private banker men trillions in worker wages for
nothing. This is seriously disturbing, yes, but
seriously important to address openly in our spaces
to remedy with a Johnny Wizard World Wide Work of
Wonder, Super CNN Special of Specials, with Your
Host, the One and Only, President and CEO of
Shareware Earth Co. John Himself. Hey everybody!
Wow eh? So a.. when is the good guys showing up?
Now. Justice. I want US to Host Coast to Coast for
open Public communications, where things get
solved because we know whats we're learning about.
We of god, this way comes, then men and women with
calculators to know: giving money to private bankers
on hopes they'll lend a small fraction some back
to ourselves at high interest is dumber than rocks.

Arab American rally in Dearborn for Gaza
http://www.youtube.com/watch?v=AVP4_-u6MV0&NR=1

Israel Drops White Phosphorus Bombs, Littlest Victims Suffer
http://www.apfn.org/apfn/DU_Israel.htm

My friends, demonic evil forces do exist to STEAL
the living rights from anyone of us, especially
including the Jews. Remember, it is the zionist who
steals God's good name through lies left unchallenged
by private corporate interests tied to the CON of
private banking in total. Christ is a Jew too.
Israeli broke the truce knowing such action woud get
killed Jews in Israel, a cash bonus! Like starving

Jews do attest on a infomercial that ran for near
18 months across Canada. Then covered by the Israeli
press, that the Zionist officials there actually
enjoy the prospect of suffering Jews because it,
OUR SUFFERING, will attract more charitable aid the
ungodly criminal enemy can use elesewheres! Hitler
revisited. I am the Son to God and I wouldn't lie
to you about an issue as hughly Satanic as this.

White Phosphorous: Israel fires artillery shells into Gaza
http://www.sott.net/articles/show/172089-White-Phosphorous-Israel-fires-artillery-shells-into-Gaza

/ / My relative's neighbors- 3 young children- were
all killed today \ \

-

Satanic Enemies of Christ

CNN with Blitzer allowed reported on Larry King
that Hamas broke the truce, without any uttering
of fact. While when the nazi israelis were accused,
just minutes earlier, Mark Regev could say only
silence. The zionist Satanic enemies of Jews speak
only silence, because they know they are satanic
enemies liars of Human will.

Again, these SATANIC enemies break their truces
everytime, then state, it is Humanity's fault
because CNN will never ALLOW the humans to know.
They are murdering innocent People in hospitals
for example, or those in a Church, just as
amerikan bushite nazi grunts do for the escape
of the neocon zionists responsible for 911. To
hunt a lawless bushite nazi grunt, and kll it
instantly is to defend it's next innocent
bombing victims. Bush and Cheney closed 911
investigations on 911, therefore killing a
lawless bushite traitor for our Humanity is
just to get ourselves together to arrest those
responsible for mass murder on 911. The deaths
of bushite zionist liars is a mercy given for
the love of God. Die bushite die.

Israel Nazi State

Israeli nazis state they will murder humanity
indiscriminately until rockets stop falling on
their country. Yet, they broke the truce. They
always break their truces. Understand these
Satanic enemies of God, dropped seven million
land mines on Lebanon when learning the conflict

was over. They will kill Jews for money, THEY are the Nazis. Nazi Mark Regev is clearly insane. 'It wasn't israel that started this' He could not stand with any man without instantly being exposed to All of Humanity as a war criminal in need of immediate public trial for death sentence. These are only innocent people being bombed. In a concentration refugee camp. Look, it's a prison camp. And if YOU
were a prisoner there, and Texan child rapists are something you'd wish to defend your community from, you'd maybe join the Gazan police force, run by Hamas, a political group democratically elected. All police officers in Gaza, Nazi israeli claims warrant 1000 lb bombs, not warrants for arrest for a criminal offense. Remember, it was Israel that broke the truce, as so is spoken by Palestinian government officials speaking internationally - using the example from November. But understand, as Satanic fraudsters, they always fuck over Our Innocent Humanity this way.

What kind of "Human" would commit such crimes against Life? Cheating Liars for Satan God tells YOU.

The Bible "I know the blasphemy of them which say they are Jews, and are not, but are the synagogue of Satan."

Look, these enemies of Life steal INNOCENT PEOPLES HOMES as thieves of The King of Jew's simple philosophy.

-

Gray Ghost

/ / Funny thing noone ever shows pictures of the scumbag Hamas rockets falling on Israeli civilians, but the nooz is full of Palies suffering. Fuck you all I hope Israel exterminates the vermin. \ \ He can advocate the MURDER of innocent people for the neocon liars, and Google doesn't destroy his account?

Remember Zionist Nazi Israeli started all their murder rampages against Innocent Peoples for 'free' welfare money, as broke the truce with, IDF funded Hamas on Nov. 4th. They have been indiscriminately bombing People with excuses that never do add up. Example: Nazi Israeli stated they were in the right to murder ANYONE

in a car or truck in the entire nation of
Lebanon, (especially in the Jewish communities)
because like enemy "Gray Ghost" would say, all
those innocent Peoples deserve TO DIE AS MURDER
VICTIMS for his sadistic ungodly pleasures.
Remember, Nazi Israeli didn't mention this until
thousands has already been murdered, then even
still, without radio, TV, or newspapers, telephones,
or sky writing how were ONLY THE INNOCENT JEWS
as officially targeted to know? Then the seven
million land mines to kill innocent kids for
generations. To the enemy of Life, Gray Ghost
it matters not that Israeli started the conflict
by sacrificing nazi vermined trashed as Satanic
dumfuk enemy soldiers sent across the border,
to Grey Ghost, all it knows, is Justice must not
be allowed to win this game for our human race,
for he would be truly seen as a sadistic enemy
of Freedom, powerless, or rightly dead for
his proud treasons against life in this universe.

ZIONIST DEMON LIARS TO SHOW HIT ON TRUCK FULL OF ROCKETS ACTUALLY HIT
TRUCK FULL OF WELDING TANKS
http://english.aljazeera.net/news/middleeast/2009/01/20091117737115874.html

Please John begs all People's of Humanity,
Americans do not have the courage to even speak
concerns for their dying as evil state of godless
private banker ruled blind tyranny. 'Duh, yeah
give billionaires trillions, trillions, TRILLIONS
to help the poor homeless mothers poisoned by
FoxNews CRIMINALLY.' Gawly je, I dunt no y dat
detnt work-ed' - o wel, cary ohn my wayward Son.

Livni: Gaza truce would give Hamas legitimacy

See? this is why NAZI I$raeli thinks they have
an excuse for bombing people indiscriminately
to break a truce they signed on to. This isn't
a one time, maybe two time occurrence, but every
time in the last 60 plus years the zionists
aligned with Hitler have. Satanic enemies
of Humanity.

ANTI-SEMITE is FoxNews every time they assault God
with "Israel, the Jewish State" to torture, steal,
and murder.?. ANTI-SEMITE!

The Ungodly Zionist - a report from the front

/ / The most recent victim of Israeli airstrikes
was 10-year-old Ismail Hamdan \ \

To the Satanic enemies of Man, the Ungodly Zionist,
an innocent murder victim's life can not be allowed
a defense such as the charge of first degree murder
against Netanyaho because, he states no Justice to
any who believe in the Jewish cause, as Hillel, of
freedom as Liberty for all. If Jews ran Israel,
Netanyaho would be chastised publicly by the Humans,
for sanctioning the criminal acts of first degree
murder. The nation of Nazi Israel STEALS Peoples
HOMES. What other nation on this Earth commits
such willful crimes against innocent Human beings
OFFICIALLY? Steals homes from god loving innocent
folks and labels it our 'Justice system'? Who? Neocon
Amerika, the nation that gave trillions to bankers
recently on only prayers that their gods will maybe
lend some of their own money back to them at high
interest. But alas, evil is the deceived disguised,
as in their deep ignorance of money and virtue, they
do not understand, the private banker never covers
the loan. Never does a private banker reach into
it's pocket to borrow US to begin with - so as a
consequence, the bankers have just pocketed all the
'free' loot for nothing, TRILLIONS, and are not
saying why should they help anyone else with charity?
it's the amerikan way. Instead, hate the wise socialist
who designed a working good traffic signal system,
where lives are saved and congestion is eased, or
hate the white man, the black man, different People.
But never Mr. Bush, Mr. Cheney, or Rumsfeld, the
neocon traitors who closed criminal investigations
immediately after the crimes of 911 occurred, who
doctored the NIE to con America into death, and
never slight the trillioniare private banker gods,
who have stolen/taken our public authority through
war criminals in Congress. Taken from all others
to bring us a much poorer world suffering due to
our speakings of contempt for Justice as christians
in America - who claim in silence only indignation
for real Christian families robbed or murdered
Officially by the zionist state of ungodly Israeli,
paid for by dying America. Americans refuse to raise
their phones for the arrest of the bushmob for capital
mass murder, so, what's private trillioniare bankers
walking away with the entire economy in free fall
going to do for them, when they are already to
death for the glorious Zionist Neocon thieves of
Civilization? Proudly in hatred for Innocent
Humanity. Again, Hamas was founded by Zionists
in the IDF, to kill Jews for money - public record.
Jews starve near death in Garbage dumps of Israel,
all because the Nazi Zionist UNGODLY government

states it is beneficial to starve Jews, for, they will receive more humanitarian aid THEY can use elsewhere. Public knowledge. Zionist liars murder innocent Jews for money, like they did in Lebanon, and like the zionists did on 911 by forbidding the pursuit of the terrorists by following the crimes scene leads at the real murder scene. Unjust enemies of Man.

To arrest those responsible for 911, we are going to need to form a public warrant for a person or persons. Bush and Cheney are guilty of closing investigations on 911, treason, called obstruction.

UnHoly Nazi Israeli Racists are Greater than the censored words of Messiah!

IDF's YouTube Gaza channel to Correct Ourselves

/ / it will disseminate footage of precision bombing operations \ \

Precision? They dropped seven million land mines in Lebanon, after having seeked out where the Jews lived, (Northern Lebanon), and murdered them firstly! JEWS. They, as enemies of God, like those of FoxNews, will refuse these type of FACTS on their hatred for Love and Justice. Their hatred for Jews, real Jews, like me. Understand: American baby formula has been contaminated with poisons, and FoxNews doesn't think it's important to their corporate responsibilities to kill ourselves further for profit. The Zionist will murder anyone just to steal your belief in God as Love. They HATE me for being wise and Just. Hate. For, why wouldn't America support my demands for open radio communications on the Coast to Coast radio network? Americans would rather murder Humanity before Justice succeeds beyond their illusions of grandeur through the mass murdering of ourselves for stolen gains. The banker does not cover our loans! Giving them trillions for free unquestioningly is dumber than rocks. Enough.

Fake Rocket Attack
http://xymphora.blogspot.com/2005/02/fake-rocket-attack.html

Remember however, the Zionist has no qualms about killing Innocent Jews too if it means Americans will get it more free welfare to murder ourselves. They openly STEAL Peoples

homes in that nation run as thieves don't
You know? Or as it is just open public
knowledge that the Zionist excepts that
911 was actually a good thing for them as
war criminals reaping the cash rewards for
continuing capital murders?

/ / Ehud Barak promised that the war would
continue ï¿½to the bitter end.ï¿½ \ \

That is you there Barak promises to end
bitterly as the innocent the demon targets
for ungodly murder. How could ANY REAL MAN
steal food from a Christian baby? How do they
do it?, as the inhuman. (Like bushite do in
Iraq, while on CNN in interview tell US, they
are there war criming for neocon traitors to
steal everything as "helping the Iraqi
children". They offer no clean water, no food,
just indiscriminate bombing campaigns of evil
incarnate. True fascist nazi enemies of true
freedom in America who advance censorship to
anyone like myself. Why? They lose. They are
not men but Satanic enemies of the King to
Jews, the Messiah. I Am. Thieves to the
scriptures of Hillel, and of Moses. Thieves
to the intent of every true religious person,
for God is everywhere. God is the Word, and
the Word is Holy. So, fuck you and die bushite
nazi traitors to American Justice, those of
them who refuse US open free words to resolve
their war criminal behaviors as is done in
godless Israel today against INNOCENT
Christians. Done before another innocent other
has our homes stolen, or is murdered by the
lawless grunting bushite dumfuk enemies of
Jesus Christ. I am King already, always have
been, always will be. Live with it. The Koran
is filled with great understandings on this
relationship. Christ is mentioned more than
Mohammad - and Mary can be understood as the
mother of all being before we are. a virgin.)

Look humans, you've
had your fun murdering yourselves, now the wise
people will compete for bettering ourselves by
understanding. Who the fuck are these illiterate
monsters at CTV national television? and how can
they willingly keep our soldiers in the dark dying
that way by simply smiling? Are they experts in
anything? are they respected researchers? writers?,

politicians?, civil rights lawyers? - do they even
respect ourselves enough to be warned of vaccines?
NO, instead they LIE with contempt for Humanity

Lawless Police to Defend Who Again?

They Call it Terrorism

"Israeli nazi enemies call bombing people,
like they do without apology, terrorism.
What can't you figure?"

CNN TODAY

/ / Stand down 'Christian' nation. It's
not your babies. Ethnic cleansing is not
a 'sin' as long as the 'chosen ones' of
Israel do it. \ \

Israel, the nazi enemies of God nation broke
the ceasefire on November 4th. Now, as demon
liars claim they want to honor a ceasefire
again to further steal ourselves from the
Love of Justice. Why do the godless Zionist do
this always as first degree murderers? Because
they can't win an open debate on their treasons
against God and Man. The private bankers DO
NOT cover our loans. Again, these SATANIC
ENEMIES OF GOD dropped seven million land
mines on Lebanon while target killing JEWS.
INNOCENT JEWS. Targeted. Northern Lebanon,
look it up. Israeli MURDERED Jews. Innocent
Jews as targeted for more stolen charity. I
again, beg you to support my call for war
crime trials against the bushmob, including
CNN demons who report a total contempt for
YOUR life dying. Your call loser.

ISRAEL: No civilian casualties in Gaza!
http://uk.youtube.com/watch?v=RlZd3vR6Kzk

Satanic enemies of God as anyone included.
Think: who buys these demon lies to steal
further from our innocent Humanity? Zionists
do at CBC and CNN, who will murder America
by openly lying to destroy freedom. Example:
CNN reports Georgian nazis who targeted
children schools, churches and threw grenades
into our homes to murder as minions for Satan
are called freedom fighters. Just like the
Third Infantry, the new lawless police officers
of California, who can't be charged with rape
for example, because ONLY Rumsfeld can okay

such prosecutions. Hey who cares for Iraqi Rights right?, for TV America's CNN with FoxNews and George Norry doesn't, for it's only American women and children now right nazi enemies? And WE ALL KNOW, cowardly America refuses to even raise their phones for these dying concerns. How can George Norry continue to live happily dying America for the neocons? How? they let them. Alex Jones thinks George Norry is just fantastic, so no, don't encourage the NWOers to demand free communications, because if we did, Alex Jones and the like, would factually look like the idiots he is. (better to die America than face this foolishness?) The banker doesn't cover our loans, we do Alex. So giving them trillions in American worker wages is a bank robbery in progress. Simple. NOT a diabolical ingenious plan, we, the simple folk can't figure without the Alex Jonesers geniuses of thought control developed by the CFR, builderberg, the Boners and NASA.

Exactly as my tests have shown me. Using a coil and toroid with given same inductance say 20uH to achieve the same resonance the top part of the vertical over the toroid was about 8" longer, then the top portion of the vertical over the coil, just as you stated, More electrical degrees in the coil than the toroid.
I was wondering if the self shielding properties of the toroid would have contributed to this conclusion, and because of these properties, the toroid not have any electrical degrees, so to speak, so when it come to the radiating element it would need to be slightly longer to see the electrical degrees for the wavelength or resonance frequency injected into it. thanks again for the info.

I suspect that the VF of the toroidal loading coil is much
higher than the VF of an air-core loading coil, i.e. the
toroidal loading coil occupies fewer electrical degrees of
the antenna. It makes sense that if the toroidal loading
coil occupies fewer electrical degrees of the antenna that
those degrees must be furnished somewhere else. The toroidal
loading coil seems to be closer to the lumped circuit model
than is the large air-core loading coil which generally
requires analysis using distributed network techniques.

http://www.ttr.com/TELSIKS2001-MASTER-1.pdf

There are two things happening with a base loading coil.
The loading coil occupies a certain number of degrees,
e.g. ~36 degrees for a 75m bugcatcher coil. The stinger
occupies maybe ~11 degrees for a total of ~47 degrees.
The other ~43 degrees comes from the phase shift at the
impedance discontinuity between the coil and the stinger.

With a center loading coil, a few degrees are lost at
the impedance discontinuity between the base section and
the coil. That's why a larger coil is needed for a
center-loaded mobile antenna.

First, since I am new to this ng, let me say hi to all.

Now the good stuff. I have always wondered this, but
like a multi band dipole, the reactance would lead the power to the
radials that are reasonant, and make the unreasonant radials invisible?
Would they have to be spaced apart, or could they be 'bundled'
(but not touching)...
I ask because I was thinking of making a 20/15/10M ground plane out of
an old copy of Ham Radio Anthology from 2003. They only have one radial
for 20 and 15, two for ten. And I was wondering why not just
piggy-back reasonant wires for all the bands..You may have answered
my question.

Sorry to interupt, but thanks for the info!

Hi Bob,

Obviously not? Of course it is for at least 40M (overall length); and
of course it is for at least 10M (to the first notch); and half a wave
for 15M and half a wave 20M. Half waves are two quarters....

Those dimensions are the intent of tuned radials. Tuned radials have
some integer relationship to a quarter wave. Some commercial designs
might offer radial reactance (non-quarterwave relationship) to balance
out the inverse reactance seen in the vertical, but I don't think we
see it here.

Proximity to earth will change all of this, however. Layout a longer,
overall length without cutting the notches and tune for the lowest
band. Use that last 3 foot section to do this (like making it 6 feet
long at first). I would then work on the first notch for 20M and cut
it out long too (the 3'10" section is redundant and thus expendable)
so you can shorten towards the base. Then I would work on the second
notch, but cut closer to the base (say, at 18' from the base) and trim
towards the end to tune in 15M.

The same thing (compactness) could have as easily be arrived at by
using in dependant wires, all cut to quarter/halfwave and bundled
together. There is nothing particularly remarkable about the twinlead
in its own right except for mechanical stability.

The DX Engineering phasing controller, with two active antennas appears interesting. (My 80 meter reception, with a half-sloper on my tower, is not good -- and 160 meters is worse.) They also have the 4-square setup receiving setup.

Question: Does anyone have comments on the 4-square version versus the 2 antennas with a phasing controller? Pros and cons?

The term x is the phase of the cosine function, Cecil. The phase of the standing wave function varies by 90 degrees along the length of a 1/4 wave resonant standing wave antenna.

I'm sorry, Jim, that is just not true. The standing-wave
function has a *constant phase* along the length of a 1/4WL
monopole for any fixed (t). Cos(x) is the *envelope amplitude*
function (not phase function) for any fixed (t).

What Gene Fuller said previously is true regarding the
cos(kz)*cos(wt) term in a standing wave:

Gene Fuller, W4SZ wrote:
> In a standing wave antenna problem, such as the one you describe,

>
> The only "phase" remaining is the cos (kz) term, which is really
> an amplitude description, not a phase.

One can ask EZNEC to display the phase of the total current.
When one does that, one will see that the phase is ~constant
for a 1/4WL thin wire monopole over mininec ground. The change
in amplitude is what allows us to calculate the actual delay
through the wire using an ARCCOS function.

Peter,

Your reference is interesting, their story is changing from
http://science.nasa.gov/headlines/y2008/11jul_solarcycleupdate.htm?
list174385 (fix the wrapped URL).

I have been plotting the percentage of days in a calendar month that were
spotless during this transition.

Certainly, March 2009 isn't encouraging.

The graphs are at http://www.vk1od.net/propagation/solar/spotless.htm .

I wouldn't hazard a guess at when sunspot numbers climb significantly,
though signs are that the transition has already occured, just enduring a
very long sunspot drought... from Canberra where it doesn't rain any more
either!

Very interesting data, Owen. This is a new way to look at the transition but to my eye a downward trend hasn't emerged yet and that certainly is bad news for 2009.

Another idea I had recently, but haven't found any records of this method of tracking solar cycles anywhere on the net... perhaps you might know. This idea was prompted by the observation that so far in 2009, if I'm not mistaken, the number of Cycle 23 sunspots outnumbers the Cycle 24 sunspots, so the situation is even more dire when this is considered. So the questions in my mind are:

1/ Don't the Cycle 23 spots have to vanish completely before we can even begin to say that we have entered the new cycle?

2/ If not, then how far into the new cycle are old spots allowed to occur without casting doubt on the fact that the new cycle has begun yet?

I looked all over for a plot of old spots superimposed on a plot of new spots, so that I could get an idea of how long the overlap period typically is. But this is the data that I couldn't find anywhere. Any ideas?

I don't think we're past minimum yet. We might be in it right now, and possibly for several more months. I say this despite the fact that there have already been a number of Cycle 24 spots. This minimum is looking like a double-minimum, ironically the inverse of the Cycle 23 double-maximum.

I am a little confused, you say about the coil and the stinger
occupying a portion of the total 90 degrees, (I can follow this not a
problem), however I thought the purpose of the coil was to add
inductive reactance, due to the shortened length of the radiator, less
than 1/4 wave, therefore having a capacitive reactance overhaul. Let
the shortened vertical be 34-j234 ohms. My understanding is that
depending on on what the reactance is at some freq, I need to offset
this negative reactance with an equal positive reactance. I wasn't
looking at from a degrees point for view. Or is it just 6 of one, half

dozen of the other, both be equal just expressed differently, I like the degrees point of view for a couple of other arrays I am experimenting with. (long wires) I think it will simplify things a whole lot. thanks again for the info and the links, very valuable info. 73 brett

One criteria is the point in time (month?) when there are equal new
sunspots and old sunspots.

The so-called butterfly diagram is of interest, see
http://sidc.oma.be/images/papi22c.png .

High latitude unspots are usually 'new cycle' sunspots.

It depends upon which math model is being used and
whether the math model is valid under the existing
conditions. We can neutralize capacitive reactance
with a lumped inductance or with a stub or with a
helical coil. The results are approximately the
same but there are differences.

If the current amplitude changes significantly
between the bottom and top of the loading coil,
the lumped circuit model is not valid because
the coil is an appreciable percentage of a
wavelength more akin to a transmission line
than a lumped circuit.

Which presupposes that an instant actually divides
two cycles. :-) My 130/85 blood pressure used to
be normal for my age. Now that exact same blood
pressure is pre-hypertensive even though I'm 20
years older. I've concluded that human concepts
create reality, not vice-versa. :-)

I know what you mean, Cecil. It used to be that marriage was between 1 man and 1 woman...

Oops, that was off topic. Back to the subject at hand.

Owen, those butterfly patterns are neat. It's hard to tell, but it kind of looks like old and new sunspots can overlap each other for maybe a year or more! Wow. I didn't realize that. So maybe there still is hope. But I sure wish Cycle 23 spots would go away.

Now it is clearer to me. I understand why there is a difference using lumped circuit analysis as opposed to the the actual coil or stub analysis. You have provided much valuable info on this subject. Thanks again. I will load some math program on my pc any do some of the analzsis of my design and compare it to what I have measured now with the ones I have built

The reason this came about to me was to use some very short but extremely strong 1.5" insulators that I have.In order to get the required inductance with the length of insulators that I have the losses in the coil would be large, that is why I chose the toroid.

Did you ever try to model a resonator where the coil required is actually longer than the insulator, so that the vertical part of the resonator is actually inside the coil , would it somewhat have a larger inductance then the expected air wound value, similar to a coil with a ferite inside it (tuning slug) or would the radiator not even see the amount of the coil that it covered therefore have a lower inductance. I was thinking, instead of spreading the turns on the coil to adjust amount of inductance simply move the vertical element in and out of the coil to adjust it. There discussions before were for a center loading coil which will be constant, but this last part of discussion I would like to try for base loaded coil and make it variable but not tap it conventionally . Hope I described well enough for you see what I have in mind, Again thanks for the info.73 brett

Hi Tim,

Welcome to the free-for-all called newsgroups.

Wires that are adjacent are invisible in one sense, and fully visible
in another, and partially visible on the third hand.

Resonance is not, in an of itself, a condition that denotes
visibility, or even radiation. Resonance (or the lack of resonance)
is merely a characteristic - one of many.

Resonance in an antenna generally means the lack of reactance.
Reactance brings us back to adjacent wires. If a wire is resonant,
and another wire is brought into proximity, that second wire will add
some form of reactance and shift the resonant characteristic of the
first wire. Hence, if that second wire lacks mechanical integrity, it
will add/subtract reactance as the wind blows - not a pretty prospect.
This is benefit that is brought to the Butternut by using twinlead. I
would point out that this benefit would be quickly lost if they need
two twinleads to support more bands.

The Butternut radial design is simply a variation in the fan dipole where several wires are connected at one point, but each wire resonates in a different band. When constructing a fan dipole, the general advice is to maintain some distance between the wires to reduce interaction (the addition/subtraction of reactance to neighboring wires). This separation is not herculean, six inches to a foot is often quoted, and reports tend to emphasize the distant ends being that far apart, with the ends at the common point being "fanned out" to them (hence the term fan dipole).

The practicality of construction is found in the separation of the wire. The twinlead construction is going to be the most difficult (but not impossible, obviously), whereas wire that is radically separated will have minimal interaction (aka invisible).

Hi Brett,

After following Cecil's pet theory, and your statement of finding it useful, your question above becomes a remarkably perplexing application of that knowledge.

The theory should have answered your question before hand. The typical shorthand explanation for coils' length equivalency should have too. The fact of the matter is that for a given height radiator, there are probably an infinite variety of values for inductance along the length where the radiator is broken for that coil's insertion. One inductance value (however it is wound) is not equivalent everywhere - hence the proposition of a coil having an equivalent length is rather preposterous.

Most loaded vertical design proceeds along very few lines. The first consideration is coil placement which is largely dominated with one consideration: radiation resistance. The optimal point (for an optimal size of the coil) is somewhere between 40% and 60% the way up (adding a top hat lends to the variability). Sub-optimal designs abound and are freely offered everywhere without explanation (but long on unsupported claims).

Knowing the insertion point, the second consideration is overall height in relation to wavelength. If the vertical is a loaded one, we here in the group can well anticipate that it is going to be a very short one seeking "special sauce" enhancement. Height and wavelength will dominate the coil inductance at the given insertion point.

Knowing the insertion point and the height/wavelength, the coil's inductance is fairly well defined. The third consideration is keeping its loss low. So far I haven't seen that pursued to its logical conclusion to instead see discussion wander in the poppy fields of electrical length (that was solved with inductance). Loss drives you to make the inductor large, with large separations in adjacent windings. Tightly wound coils, or toroids in the basement band might be useful at night for an aviation beacon light.

Worry about filling the coil's axis with the radiator is focusing on the wrong problem, remove the excess, or fold it into the turns of the coil. This may alter the inductance slightly, but that can be taken

care of with trimming at the top - trivial stuff. Stacked tubing makes this less than trivial. You go into this expecting that kind of flexibility because antennas are not designed straight from paper to elevated tube the first time.

Ok, looking at fig. 6 of the pdf, 4 bands,2 wires. I assume that the
long top wire is somewhat resonate on 40 and 15, with the clipped wire
being for 20 and 10. That means one wire is both 1/4 and 1/2 wave.
I should have looked better at that because I am picturing a 1/4 wave
vertical with a half wave radial...Or with rf, wouldn't that matter?

> The practicality of construction is found in the separation of the

So then on my triband vertical idea, I would be better off staggering
radials around in a fan shape, say one every hour of rotation, (3 bands,
4 radials) and have four resonant radials connected by some insulating
material for mechanical stability. Harder to make but easier to tune.
Going to look like a multi band vhf antenna on steroids, but as long as
it works......

I am glad I came upon this ng. I like learning about antennas, it's
about the only area left that every ham can tinker with anymore.

Source record: 16551

Many on this newsgroup are aware of my views on radiation which I then took to the QRZ antenna page because of the fraustration created by lack of knowledge of equilibrium by the average american.
I have now run into another interpretation by americans which differ from the european aspect and that is Newtons third law with respect to reaction . Definitions on the net view this law as an equal and diametrically opposite force where Newton never used the word "diametrically". English law is based on the intention provided by the words of the law such that it becomes unchanged thru time. American law does not define "intention" thus the law can and does change over time creating appeals against the intent of words.
One definition of Newton's law on the net shows two skaters pushing against each other as an illustration of the law. But Newton's "intent" was in the olde english where "opposite" was viewed in a different way.
If you view a helicopter the front rotor is in a horizontal plane and rotating clockwise thus per Newton the resulting action is a rotator at the rear that is rotating in a "vertical " plane and rotating counter clockwise to maintain equilibrium. Another example is a caramel bar that is placed under tension which produces a force at right angles that narrows the cross section and the sample fails in shear at 45 degrees (vector resultant of the two forces)
I bring this up because of what I have stated earlier about radiation on this newsgroup, where the applied force is electrical on a radiator and per Newton the reaction is at right angle to that force which is called the displacement current (capacitive magnetic field). No wonder Einstein gave up on the pursuit of radiation because as a german had no understanding of olde english and thus was looking for a equal and diametrically opposite force in his search for the "weak force." He was correct in his prediction of it's presence with respect to radiation but, unfortunately, was looking in the wrong place and thus relativity was born!

Hi Tim,

I already offered my best guess on that. Conversion of feet and
inches to meters gives the story.

>I should have looked better at that because I am picturing a 1/4 wave
>vertical with a half wave radial...Or with rf, wouldn't that matter?

It is only half the story. What the vertical element offers is the
other half. The natural presumption is that it is a quarterwave in
its own right, but with HF Multibanders, that can be a presumption too
far. As they are generally loaded for the lowest band, tuning is
difficult, narrow, and performance seems to suffer there (from my own
experience with a GAP and other's reports of theirs).

It probably won't be as easy as that, but it won't be as hard as
anything any more cute. Even then, the shortcuts often work if you
observe all the "gotchas," which usually means lifting the contraption
into the air 10 feet or so.

1929. NEC model of an 80/40 dipole using bootstrap coax traps

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-03 07:03:22 UTC
From: Owen Duffy <none@no.where>
Message-ID: <Xns9BE2B7AD962CBnonenowhere@61.9.191.5>
Source record: 16553

I have constructed an NEC model of an 80/40 dipole using bootstrap coax traps. I have generated a helix of GW elements for the RG58C/U coax coil, and use NT cards to model the coax interior.

Plain conductors are loaded with copper conductivity.

I am grappling with approprate conductivity for the outer surface of the coax coil, thinking that it must be greater than copper because of proximity effects and braid effects. I have initially tried loading those segments with conductivity of one tenth of copper... but I don't expect that will make the RF resistance tenfold.

With those numbers, the loss in the interior of the coax is more than half the total loss.

Has anyone experience or thoughts on an appropriate way to load the conductor representing the outer surface of the coax coil forming the trap?

The model is below for anyone wanting to play with it. NOTE: the NT cards are appropriate only at 7.05MHz. Some wrapped lines will need fixing.

Owen

Never modeled it but have seen its effects during
75m mobile shootouts. One fellow had a hamstick
with the stinger bottom extending down into the
hamstick loading coil. It was a very lossy
condition which improved when he hack-sawed the
excess stinger off.

Do you have EZNEC? If so, I can modify a helical
loading coil to extend the stinger into the middle
of the coil and send the file to you.

Conductors within the loading coil field lower
the effective coil Q. However, I have had good
luck with a 1.25" fiberglass pipe running through
the center of the coil providing mechanical
support. Perhaps you could consider swapping your
insulator for a piece of fiberglass pipe or rod.

> inductance value (however it is wound) is not equivalent everywhere -
> hence the proposition of a coil having an equivalent length is rather
> preposterous.

Nobody said one inductance value is equivalent everywhere.
In fact, just the opposite is true. The equivalent length
for different coils with the same inductance depends upon
their physical configurations.

For instance, w8ji's loading coil (100t, 10tpi, 2"dia)
calculates to have a VF of 0.0328 while my 75m Texas
Bugcatcher coil with approximately the same inductance
calculates to have a VF of 0.0198, a 66% difference
proving your above premise to be false.

****
THERE IS NO REQUIREMENT THAT TWO COILS WITH THE SAME
INDUCTANCE OCCUPY THE SAME NUMBER OF DEGREES OF ANTENNA.
****

To understand the details, just compare the following
1/4WL resonant stubs:

---25.3 deg Z0=600 ohm---+---10 deg Z0=50 ohm---open

---70.6 deg Z0=100 ohm---+---10 deg Z0=50 ohm---open

Both stubs are electrically 1/4WL = 90 degrees long.

How can 35.3 physical degrees of stub perform a 90 degree
stub function? Hint: There is a 54.7 degree phase shift
at the '+' junction.

Why does the second example require 80.6 physical degrees
of feedline? Hint: There is only a 9.4 degree phase
shift at the '+' junction.

Why does it take 70.6 degrees of Z0=100 ohm feedline
to perform exactly the same function as 25.3 degrees
of Z0=600 ohm feedline?

Both stub segments, Z0=600 and Z0=100, are providing
the same inductance at the '+' junction point, yet
one is 2.8 times longer than the other.

Is "the proposition of a piece of transmission line
having an equivalent length rather preposterous"?

Reminds one of an outburst of complaints about interferenec to to TV
from one UK radio amateur station back in the 1950s.
While Britain had some TV back in 1937 the 1950s saw a fast growing
increase in domestic TV set ownership; quickly nicknamed 'The Telly'.
The interference complaints bubble burst rather rapidly when it turned
out the amateur in question, ad all his family, had been away from
home for the entire period of the complaints!

I've been surprised at some of the openings on 15M to Europe and Pacific the past few years, in the quietest part of a quiet cycle. And the regularity of night-time 20M openings to Northern Europe/Russia and even occasionally New Zealand/Australia too.

I mean, it's nothing at all compared to say 1979 when I was a new ham 10M was open around the world at almost every hour of the day. But it still happens.

Certainly I've been enjoying 40M/80M/160M the past few years.

One thing that I don't see charted so clearly... is that in 2003/2004/2005/2006 I remember several solar storms that pretty much wiped out all the HF bands (high and low, well 80M and 160M were not so badly affected) for a few days at a time. I don't remember this happening at all in 2008/2009.

Ahh, I had the idea of doing such a thing (add vertical travel) for my bugcatcher to fine tune swr if it needs tweaked a little. But it looks like I'll be hopping outside the car a lot after all.

For 75/80 meters, I have like 4 separate taps.

The Butternut twinlead appears to be connected at each end, forming a
single wire folded back on itself. Is that the same as a fan dipole?

Source record: 16562

Quick question... when someone tells you that their receiver provides 12dB SINAD (or whatever) with an incident field strength of, say, 20uV/m, is 20uV/m an RMS value or magnitude? Or isn't this standardized enough that one should assume?

From some Googling RMS appears to be the standard, but I wanted to ask some folks who really know...

(Back in school, in EM classes it was always magnitudes...)

Thanks,
---Joel

Hi Bob,

Look closely at the figure. The twin lead is connected at both ends,
true enough; but it also has added wire. The connection at the far
end of the twin lead actually defines two paths, and the connection at
the near end defines two paths. Any one path that is resonant at a
quarter wave is going to swamp the other paths' reactances.

This is the trick of the fan dipole. Those extra leads' present
hugely mismatched Zs which do not accept power, and the one lead that
is matched (at resonance) takes all the power applied - very
convenient. When you shift frequency, another wire becomes resonant,
leaving the others to mismatch. This is the simplicity of the Fan
Dipole that resides in these multi-band radials.

Which apparently nobody (somebody, everbody?) said.

The power of persuasion (Cecil's Degenerative form of the Sub-optimal
Hypothesis of Information Transformation) at its inventive best to be
able to wrestle two contradictory claims together and prove them both
true and false simultaneously!

Cecil must have been posed some very difficult advice as a little
nipper:
"Nobody jumped off the roof because everone did - wouldn't you?"

Try changing the resistivity by a factor of 2 or 10 and see if the model
results change significantly. It might be a non-issue.

>

Thanks Jim, I did such an analysis and should have posted the results.

The majority of loss is in the interior of the transmission line as posted. If I change the conductivity of the segments used by the coil, total conductor loss halves, so it seems signficant.

I am thinking that with proximity effect likely to confine current distribution to perhaps one fifth of the shield circumference, and effects of braid on RF resistance, the effective RF resistance of the outside of the shield might be five times or so the resistance of a copper tube of same diameter.

I assume that NEC will not be modelling proximity effect, but I could be wrong.

Do you have any suggestions?

Owen

I wasn't very clear there... I loaded the segments with one ninth of
copper, and that was additional to the overall loading equal to copper, so
the effect should be resistance of ten times copper for the coil segments.

I have the top portion of the antenna put togather, ready to go up in
the next couple of days depending on wx, after I got it put together I
realized that when I got the toroids I was only concerned about 40 &
80M, and then wanted 160M, should these be some what acceptable on
160M with 100watts Their red on the inner, outer, and top, the bottom
is some color of a green or brown. It measures very close to 26mm
outside,15mm inside and 10mm high. No markings what soever. Any
thoughts on if it should work or not. thanks 73, brett

Refer to a table of sines and observe the two things which vary
throughout the period of any sinusoidal wave. One of them is amplitude.
What would you prefer I call the other one?

Hi Brett,

Matching theories to questions is a favorite past time here.

>Knowing me I will probably ask many more questions

Just asking the same question again will lead to many more
theories....

You haven't been entertained until you get the gaussian vectorized
version of the equilibrated coil constant of capacitive electrical
length.

I will sit back to await Cecil's indignant demand that NO ONE
theorized that either; and then NO ONE will spit rhetorically in his
eye saying that they didn't but they meant too. ;-)

RE- google: And your point is?

Although the main newspaper in LA (City) is the Times, there is a newspaper
in LA County called the Press-Telegram. It's in Long Beach.

The date of the article is conclusive; the name of the alleged newspaper is
NOT - it's a common mistake. The LBPT does have some readership in LA.
It's one of the County's major regional papers.

> What would you prefer I call the other one?

Did you not understand what Gene Fuller said?
Io*cos(kx) is the amplitude term. If kx=0 then
the amplitude is Io. If kx=pi/4, the amplitude
is 0.707*Io. If kx=pi/2, the amplitude is zero.
cos(wt) does not vary with (x), only with time.
At any snapshot in time, e.g. t=0, the phase
does not vary at all.

They aren't usually color coded on the "bottom".

If they are iron-powder, red is material #2, which is good for .5 Mhz
to 10 Mhz.

The size seems closest to T-106, which in inches is 1.060 X 0.570 X 0.437.

You can find all the specs, charts, etc. at:

Thanks again I'll do a search on net for the color codes, I have some with some # on them but the spec on them are only good for 500khz or well below HF freq. Since some had numbers and are of different color i didn't know they had color code, I have some red , blue, yellow and 1 green, I'l look for the color code thanks. 73 brett

Thanks for the link to the info on the color codes , I have the red one in the antenna right now ,I was going to test soon, According to the document on the link, the red toroid spec is 2-30mhz but blue toroid spec is .5-5mhz.
The blue one I have is close to 25mmOD 11mmID 10mmHigh. I'll redo the blue toroid for the inductance I need before I waste my time with the red one Thanks again 73,brett

Yeah, the numbers I quoted are from some old data sheets I have for
some torroids I have.

For whatever reason, some of the numbers are different on their web
site.

I have no clue if that's because the product changed over the years
or the old sheets were wrong.

YMMV.

I realize this may be a terribly basic question but at any given transmitter power will the highest current measured in the antenna feed line occur at the lowest SWR or not.
--
Tom Horne

"This alternating current stuff is just a fad. It is much too dangerous for general use." Thomas Alva Edison

At the lowest SWR, 1:1, the steady-state RMS current along a lossless transmission line is everywhere the same. At high SWR, the steady-state RMS current along a lossless line varies between some high value and some low value; the SWR is the ratio of the high value over the low value, assuming the line is long enough that you won't find higher or lower by extending the length of the line.

If the antenna feedpoint impedance is, say, 10 ohms and you feed it 100 watts, you should measure sqrt(10) amps at the feedpoint. You'd have a 5:1 SWR on a 50 ohm line with that load. With a 250 ohm load, you'd also have a 5:1 SWR on the same line, but the current at the antenna end for 100 watts delivered to the antenna would be sqrt(0.4) amps, or 1/5 as much current. If the antenna represents a 50 ohm load on the same 50 ohm line (swr = 1:1), the current is sqrt(2) amps for 100 watts, an intermediate value.

Hope that helps (and that I haven't screwed up my mental arithmetic).

Cheers,
Tom

Reminds one of an outburst of complaints about interferenec to to TV
from one UK radio amateur station back in the 1950s.
While Britain had some TV back in 1937 the 1950s saw a fast growing
increase in domestic TV set ownership; quickly nicknamed 'The Telly'.
The interference complaints bubble burst rather rapidly when it turned
out the amateur in question, ad all his family, had been away from
home for the entire period of the complaints!

I removed the red toroid from the vertical and replaced it with a blue one, I'm hoping to get this thing up today to see how it performs. I'll do some tests on it for a couple of weeks then maybe try the red toroid anyway to see if it too will work.From the specs I found red being 2-30mhz and blue 0.5-5mhz it seems obvious that the blue one is the better choice for 160 but not a good choice for 40M. And vice versa the red one better for 40 but a good choice for 160. I will to to find out more info on color code and material type, I also have a couple of type 43 binocular core very small black ones, that a fellow ham gave me, they measure about 15mm long X 11mm wide X 7mm thick the two holes are about 7mm center to center and 4mm in diameter. I used these on rx antennas, one wound 9:1 for an EWE and another 4:1 for loop, would these possibly work for tx with 100w or less on 160-40M They seem to work very well on rx for that freq range. Thanks again, 73, brett

It is.
If it were real, it would be the first law I'd break, then after
being arrested take the bastards to federal court, sue, win a gazillion
dollars and retire.

1969. Re: solarcon I-max 2000

Newsgroup: rec.radio.amateur.antenna

I'll put the I-max 2000 up without the ground plain kit for now and see how
that works.

I have made a ugly balun up to put into the deed line.

Where do I put it to, just below the Ariel or at the bottom of the main
mast?

Also is it best to isolate the I-max from the stub mast or connect it
direct?

Thanks

Hmm
How do you know for sure that the arms are not part of the radiator ?
The specs say no "ground" plane required which suggests no buried
wires
as artificial ground is supplied

For the same amount of delivered power, the highest
current will occur at the highest SWR assuming a
current maximum point exists on the transmission line.

I know it the same way that you and I know that the Sun will not explode tomorrow or the that the Moon will not crash into the Earth the day after.

Come on, let's get real here. I have been studying antenna theory since the Sixties and I've been building my own and buying my own antennas for just as long. I've been at it long enough to know what works and what is glorified garbage. Don't believe me? Fine, you go through all of the steps that I've been through. I'll tell you now that you'll end up in the same place. Who knows, you might even enjoy the trip.

My gut feel is either core will "work" and that unless you have access
to some lab grade equipment, you won't see any performance difference
between the two.

I had one and it got into my phone line until I choked the feed line.

Im not sure what kind of antenna it is. Looked like either an end-fed
or center fed dipole.

Owen

What is your feel for when this quiet period will in fact be breaking new
ground? I understand that us humans have only a couple of hundred years for
reasonable quality data to assume what the norm is. Bit like our Australian
climate records!

Regards

The antenna was on a PVC mast, I wraped a few turns of RG58 using the
mast for a coil form. Its been a few years since I had the antenna up
but I think I had the choke 1/4wl or 1/2wl from the feed point.

Tom

If you have the patience please bare with me as I'm hoping to learn
something here. I was trying to figure out what use if any could be
made of a current measuring device located at the antenna feed point.
What relationship would there be between maximum current at the feed
point and affective radiated power. I've been told in both my license
preparation classes that making sure that the transmitter sees a low SWR
does not insure a good signal out of the antenna. I'm looking for some
way to actually measure the amount of energy that is getting to the
antenna since it seams impractical to measure the signal strength in the
near or far fields during operation of the transmitter.

If you do not change anything about your antenna system (and that includes the feedline if it carries significant common mode current), more current means more power radiated, radiated power will be proportional to current squared.

If you knew the radiation resistance and current, you could calculate the radiated power, couldn't you. But, measurement of radiation resistance is a challenge. For some antennas that are known to have good efficiency, you could assume that the feedpoint resistance is almost entirely radiation resistance.

If by changing the VSWR, you mean that you change the antenna is some way that changes the radiation resistance, then the above does not apply because now two factors, current and resistance are changing).

If you adjust say an ATU on the transmitter side of the current measurement, maximum antenna current would usually occur near minimum VSWR, but not necessarily at exactly minimum VSWR.

But, you could do things that reduce VSWR and reduce radiated power. For example, if you insert a 10dB attenuator in the output of your ATU, you will improve the VSWR, but in most cases, reduce the power radiated.

For most radiated power, you usually need to strive for efficiency rather than slavish pursuit of low VSWR. It is not as easy to evaluate efficiency, probably the main reason people focus on VSWR as it is real easy to measure! Viewing the world through a VSWR meter is a very limited view.

I offer an example of efficiency over VSWR: my 40m antenna is a dipole that is cut a little shorter than a half wave (yes, non-resonant), so as to cause a 1.5:1 VSWR on the RG6 feedline (yes, the target VSWR is greater than 1), and the feedline is cut at a length that results in a 50 +j0 (VSWR(50)=1) load that I can plug straight on to my transceiver. (You can read about it at http://www.vk1od.net/antenna/7MDipole/7MDipole.htm .)

The bottom line is that transmission lines are a very interesting topic, and a sound understanding is better than learning Rules Of Thumb (ROT) from others, they are often wrong. With knowledge you can make informed design choices rather than excluding a whole lot of worthwhile solutions because they breach dumbed down or false ROT.

I should have written that clearer... you will improve the VSWR seen by the
ATU, ie upstream of the attenuator. Of course, the attenuator does nothing
to the VSWR on the load side of itself.

Hi,

I have been out of the hobby for a while and am setting up my station.
I'm looking for an old set of stacked 11 element yagis that were made by
Cushcraft. If you have something in reasonable shape at a reasonable
price, drop me an email at W8ABC@qsl.net I'm in Maryland by the way
and am happy to pick them up if they are not too far.

Monitoring the current would be of about as much use as monitoring any other single parameter lets say VSWR. Once optimal values are established it would provide a useful reference to monitor the condition or changes in your system. Should a significant change occur it is important to find the correct cause of the change. In the case of current or VSWr one could make adjustments to make either read the nominal value but this may not correct the actual problem.

There's an article in the Feb 2009 "QST" titled
"Keeping Current with Antenna Performance", by
Eric, KL7AJ, that will answer a lot of your
questions about the benefits from measuring the
RF current.

Here's a tidbit for you. Put a Bird wattmeter
at the antenna feedpoint and set it to indicate
reflected power (power rejected by the antenna).

The maximum radiated power from the antenna will
occur when the power rejected by the antenna is
at a maximum - assuming the feedline/antenna
configuration doesn't change. Present that fact
of physics to your license preparation classes
and see what happens. :-)

This must be one of those Sparsely Hypothetical Informative Tasers
where you have to do a linguistic rubik cube to parse just what does
"rejected" mean? We have a statement book-ended with "maximums,"
hence what falls between them (another duopoly of antennas) must be
minimally significant. When we apply the random babble dispersal we
obtain the zen:
>maximum from antenna antenna at maximum
Zoots alor! But of course.

> - assuming the feedline/antenna
>configuration doesn't change.

Assuming? This is the hypnotic cusp of self-consciousness. Why would
they change? New billing address? New area code? An existential
crisis during a phase reversal from manic to depressive? Would it
occur on the basis of rejection - like divorce (Please don't leave
honey - I can change. Honestly!)?

>Present that fact
>of physics to your license preparation classes
>and see what happens.

Rejection would seem to be the key word here simply because facts seem
to be so sparse and preparation a ghost of the last election debate.

Source record: 16711

I always assumed having more 1/2 elements in a collinear was best, because that obviously raises gain and lowers angle. So from that point of view, I was thinking that it would actually be better to use a low VF coax, since that would give you shorter length elements, thus being able to fit more elements in a shorter space. But I've also read that having the element lengths closer to actual 1/2 length (longer) is actually more efficient than having more elements at a shorter (low VF) length. Just wondering what people's opinion is on this... So lets say you have a choice between using the insulated center conductor of a VF 78 coax through brass tube outer elements and having room for a few extra elements in a given length, verses using just an insulated wire that has a 99 VF through brass tube outer elements, thereby allowing slightly less elements because they're longer, but the elements you do have are closer to actual 1/2 length. Which would be best? And this is basically various UHF bands we're talking about.

Thanks for any opinions,

Dave

Hi Dave

Opinion --
If your options are either 5 radiating elements, all slightly shorter than
1/2 wave, or 4 longer elements, there wil be no decernable difference in
which is best. If you are contemplating the construction of an antenna much
longer than several wavelengths, you will encounter problems much more
siginificant than efficiency,. So, in my opinion, the "best" is whatever
you find convenient.

Dave,

The popular explanation for these things constructed with reversing coax sections is that the currents all along the vertical are (exactly) in phase.

That explanation doesn't seem consistent with the nominal half wave elements being in fact a halfwave at VF=0.67, ie about two thirds the length. Nor does it deal with the fact that the element ends are connected to each other, ie no charge difference permitted.

I have been playing with an NEC model of eight half wave elements using RG213. The currents are certainly not exactly in phase, not nearly, and the gain in freespace at 6dBi is less than I see claimed for this antenna. People seem to justify a claim of dB gain as 3dB for 2 elements, 6dB for 4 elements, 9dB for 8 elements... in which case they must mean gain to be wrt a dipole, and therefore gain of 8 half waves would be 11.2dBi... very sus, too simplistic.

You asked specifically about efficiency. The efficiency in my NEC model (which includes internal loss in the RG213) is very good, >99%.

Confusing part is that some of the designs have a half wave sticking out the top, and others a quarter wave, similarly different treatments at the bottom, and they aren't consistent about whether the coax breaks at or near voltage maxima or minima.

I am still working on this, I suspect the antenna doesn't quite work as often explained, and not nearly as good as claimed.

Owen

Thanks for the info... My main concern between my two examples was ease of construction I guess... After stripping the coax and throwing the braid and jacket away, I starting feeling like it was kind of a waste. Then I thought... why not just use insulated wire. But that would bring the element sizes up and not allow as much room for as many elements. Maybe two less elements, which wouldn't be huge, but it would be a difference in specs. One version is 10 half wave elements using a 78 VF center conductor in brass tube, along with a free space 1/4 on the bottom and one on the top. No short at the top as my tests showed this actually lowered performance. I actually am not sure why. Independent tests done by a reputable company that does this stuff full time showed this one to be about a 10 degree angle and about 8 db gain at peak angle. Which is pretty decent and it does perform quite well in real world tests. But of course there's always room for improvement. But anything more than that and there might be some pretty bad nulls on top.

Hi Dave
Again, opinion --
It is really difficult to gt a 4 or 5 wavelength long colinear antenna to
work as well as the modeling predicts.

Have you modeled the antenna you plan to build?

Hi Tom,

Well, addressing one of your last points first...it's really not so difficult to monitor the strength of your signal, at least in a relative way, with a simple field-strength meter. Especially if you are using a fixed (non-rotating) antenna, and assuming the antenna's response doesn't vary too drastically with frequency, a field strength meter fed from a fixed antenna (always in the same position) can be a help: you can tune the transmitter for maximum field strength, and you can check that the field strength stays reasonably constant from one day to the next.

As Owen pointed out, measuring the current at the antenna feedpoint is a reasonable way to monitor the power fed to the antenna. So long as the resistive part of the feedpoint impedance is constant, higher current means more power fed to the antenna. For most "full-size" antennas, most of the power fed to the antenna is radiated, and anyway, the ratio of power radiated to power dissipated as heat should remain essentially constant, so the more power fed to the antenna, the more power radiated. It's common for AM broadcast stations to monitor their output power using an RF ammeter at the base of the antenna tower (at the feedpoint), with the feedpoint impedance having been measured accurately so that the power can be calculated (I^2 * R).

Many (most?) modern transmitters operate at maximum power output into a very limited range of impedances, typically 50 ohms, so there's often an incentive to make the SWR on a 50 ohm line connected to the transmitter output be low. However, you can put an "antenna tuner" between the transmitter output and the antenna feedline to transform the impedance seen at the input to the antenna feedline into something close to 50 ohms, if it isn't already. Perhaps your transmitter or transceiver already has an antenna tuner built in.

But also, please note that you can't use antenna feedpoint current to compare between two different antennas, unless you know the feedpoint impedance of each antenna, since the power depends on not only the current, but also on the resistive part of the feedpoint impedance. Power = resistance times (current squared). Even then, there's the possibility that one antenna is significantly less efficient than the other, and you have to take that into account, too, if you are interested in power actually radiated. That would be true, for example, for antennas that are very small compared with a wavelength: for example, for a mobile antenna for 3.9MHz. There are other factors to consider, too, like directionality and polarization and just what

it is that you're trying to accomplish (where the station on the other end is, and what the propagation is like between that station and yours).

You can go into a lot more depth about all this if you want. You should be able to find some good books about antennas and how to feed them. I'm not very current on what's good in this area; maybe some others will post some practical references.

Cheers,
Tom

xray66@earthlink.net wrote:
> Thanks for any opinions,

The velocity factor of a transmission line applies
to the differential transmission line currents which
don't do much of the radiating.

It's the common-mode currents that do most of the
radiating and the transmission line velocity factor
does not apply to common-mode currents.

So, why don't you do some modelling and see? I predict (having done it myself) that you'll discover that the gain is pretty close to proportional to length, independent of how many sections are used, at least for practical velocity factors. In fact, you can optimize the gain a bit by picking the VF, but it's not a big deal. What's important here is how the mutual impedances among the elements affects the current distribution on the elements, NOT how many elements you have. Ideally, you'll end up with something close to the same current, in-phase, at the center of each element; what you're liable to see in a long antenna (say 10 elements) with moderate or low VF is that one element out near each end will have a much lower current than the rest. The effect of that on the pattern is probably less than you'd have guessed.

The other thing that the free-space length of the elements will affect is the feedpoint impedance. I'd suggest, again, that you model it to make sure the net impedance of the paralleled feedpoints is something you don't mind matching to.

Cheers,
Tom

An interesting point. I cannot recall any of the online articles
discussing feedpoint Z, and by assumption it is 50+j0... but that doesn't
happen by accident.

Here is a deck for 8 halfwaves at 435MHz with a single stub tuner.

```
CM 8 half waves coaxial collinear on 435MHz
CM Assumes lossline TL, VF=0.667, effective choke at bottom of array.
CM Matched to 50 ohms with single stub tuner.
CM Owen Duffy 2009/04/05

```

The antenna bandwidth is quite narrow as might be expected from so many resonant lengths.

It reaches about 7.8dBi gain, well short of the much touted 9dBd or 11.2dBi.

Somebody once made a claim about answering a question with a question.
He said that it was a means of diversion. Clearly that is the case.

It's no coincidence that the phase of the standing wave varies by 90
degrees along the length of a 90 degree standing wave antenna.

Not to get into a heated discussion, but why do you want the stacked 11
elements. There are much beter single antennas out now with the more modern
design. I never ran a stacked pair, but I never got a single 11 element CC
to give as much gain as some other single antennas of around the same boom
length. That was for the 2 meter, 220 and 440 mhz versions.

I bought a single 147 -11 at a hamfest a few years ago and I was
disapointed in its performance. It didnt do as well as my 6 element
quad. I bought the antenna hoping to make better contact with a friend
who lives just barely in range when I am using my quad but contact was
even worse with this antenna. I understand this was a used antenna but
I think I restored it to near new condition. It is my opinion that the
problem may be in the gamma match and I have considered modifying it
into a Quagi to see if this improves the performance.

The manual on this antenna is so good if someone wanted one bad enough
they could build one from the drawings in the manual almost as easily
as assembling one out of the box.

```

Isn't there an inherent problem with this design when using coax sections wich have a velocity factor which differs from that of free space ?

The alternating sections rely on radiation from the outer (common mode) and a phase shift occuring along the inner (differential mode subject to the coax VF).

Because of this mismatch the cumulative phase error along the length of the antenna will result in it only being close to the required phase shifts over the first few sections. Hence the gain reduction as more sections are added.

To work properly the coax sections would need to be air spaced.

I tried the blue toroid after being made aware of the color code.I seemed to be ok regards to swr and forward power levels, however I tried it in the SPDX contest and it was a flop , 0 contacts on vertical for 80M, where I made some contacts on a dipole at 25 feet. I will try it for another week or so as I am busy with work and not able to do much work on my antenna just yet.Maybe due to propagation, but dipole at 25 feet better than vertical for dx on 80M, boggles me. Thanks again, 73 brett

But it doesn't, Jim. Both Kraus and EZNEC agree that
standing wave current phase varies by only ~3 degrees
over the entire length of a 180 degree wire dipole
(referenced to the phase at the feedpoint).

If you slide a current probe up and down a 1/2WL wire
dipole, you will find that the phase referenced to
the phase at the feedpoint barely changes and cannot
be used to determine position on the dipole. The
position along the dipole is contained in the amplitude.
The ARCCOS of the relative amplitude will yield the
position along the dipole.

Please read what Gene Fuller said:

Here's the phase of the standing wave along 90 degrees
of monopole as reported by EZNEC. Clearly, your assertion
is false as the current phase varies by only 2.62 degrees
between segment 1 and segment 10.

Who makes the quad?

I'm in the market for VHF antenna(s) to put on mast above a tri-bander
on a 50' tower.

Any clues on how much better this nonmetallic guy material would be than equivalent wire rope? How much effect would it have on an HF yagi at the top of tower up 2-3' on a mast? Would it be worth an extra $50 plus special end kits?

Also, should wire rope guys be insulated from attachment to the tower?

This is my first tower, a Glen Martin w/Hazer.

So, consider this: with lossless transmission line and each section of transmission line being an electrical half-wave long, the VOLTAGE between adjacent ends of any two sections is identically the same (including being in phase). So every feedpoint -- that is, every gap between sections -- is fed with the same in-phase voltage. Practical feedlines come pretty close to that lossless ideal, short as they are. (You can model this quite accurately to see just what the variation in feedpoint voltages is along the array.)

That does not guarantee that the currents on all sections are in phase, nor does it guarantee that they are the same magnitude, but the simulations I've run tell me that they are pretty close to being in phase. It's really not so important that they be all the same magnitude. Were it not for mutual impedances among the elements, having identical feedpoint voltages would yield the same current on each section (except the very end sections, which don't have a feedpoint connection at their outer ends).

I note that Owen has reported some different results (larger current phase differences than I recall seeing), and if I can find time, I'd like to explore those with him, but at the moment I'm tied up with other things.

Cheers,
Tom

2012. Cassegrain Antenna Development

Tom,

The models I offered (and they are very similar) do have fairly good
cophase operation.

My comment earlier was that some designs aren't nearly as good, although it
seems to degrade gain by only a small amount (though giving rise to more
and narrower lobes).

In your own time...

You're always trying to drag other people into your messes. So now, in addition to waves of average power and the 4th mechanism of reflection, we have waves that don't change phase. :-)

Fine business OM.

Yes, and w7el has verified that fact either on this
newsgroup or another newsgroup. If you have EZNEC,
you can easily verify it for yourself - anyone can.

Here's what Hecht said in "Optics" regarding standing
wave phase: "It (the standing wave phasor) doesn't
rotate at all, and the resultant wave it represents
doesn't progress through space - its a standing wave."

Hi Marv:

The phillystran should be "transparent" to radio waves and should have no measurable effect on any antenna. Wire rope will have some effect on antennas. There was an report in QST some years back that had some measurements on the effects. You may be able to find it on the ARRL web site.
I think the end kits are required to install Phillystran. I don't think you can use it just like wire rope.

news:64ea3fe9-d99b-4897-bf85-I bought a single 147 -11 at a hamfest a few years ago and I was
disapointed in its performance. It didnt do as well as my 6 element quad. I bought the antenna hoping to make better contact with a friend who lives just barely in range when I am using my quad but contact was even worse with this antenna. I understand this was a used antenna but I think I restored it to near new condition. It is my opinion that the problem may be in the gamma match and I have considered modifying it into a Quagi to see if this improves the performance.

The manual on this antenna is so good if someone wanted one bad enough they could build one from the drawings in the manual almost as easily as assembling one out of the box.

Jimmie

>>>>>>>>>>>>>>>>>>>>>>>>>

I read in a ham magazine about 20 years ago that at an antenna measuring contest a 220 mhz CC antenna had the driven and reflector elements replaced with quad types and gave much more gain. My homebuilt 8 element Quagi from QST plans gave much more gain than a 220 CC 11 element.

I built the 440 version of that Quagi and managed a 105 mile contact
using 5 watts. For a commercial quad antenna, Cubex makes a good
product: http://www.cubex.com/

I plan to phase two cushcraft MA8040 verticals with the ability to feed them in phase or 90 degrees out of phase.
My question is does the relative elevation of the verticals make a difference? My lot has a considerable slope which will put one vertical about 8 feet (2.5 meters) lower than the other.

It's absurd to talk about waves that don't change phase, Cecil. If 'it' does not change phase in some dimension, then 'it' is not a wave. Again I refer you to a table of sines.

Yes, my point exactly and that's what a couple of my
references say - that standing waves are not waves at
all. I'm glad that we agree that a standing wave does
not meet the definition of a wave.

"College Physics", by Bueche and Hecht:
"These ... patterns are called *standing waves*, as
compared to the propagating waves considered above.
They might better not be called waves at all, since
they do not transport energy and momentum."

"Electrical Communication", by Albert:
"Such a plot of voltage is usually referred to as a
voltage standing wave or as a *stationary wave*.
Neither of these terms is particularly descriptive
of the phenomenon. A plot of effective values of
voltage, appearing as in Fig. 6(e), *is not a wave*
in the usual sense. However, the term "standing wave"
is in widespread use."

Please contact w7el and ask him if the total current
on a 90 degree monopole changes by 90 degrees over
its length. Please tell us what he says.

No technical content - just an ad-hominem attack.
Sometimes I feel like Galileo up against the Catholic
priests. Like Galileo, I may not live to see the
technical facts accepted by you gurus.

Tom, you cannot seriously assert that the standing wave
current changes by 90 degrees in 90 degrees of monopole
when simply mathematics proves that is not the case.

For a pure standing wave, Io*cos(kx) is the amplitude.
cos(wt) is the phase. It is obvious that the phase of
a standing wave doesn't change with (x) - it only changes
with (t). What is it about Gene Fuller previous posting
with which you disagree?

Cecil,
I don't know how to break this to you, but, you're not Galileo,
not even close. You and Gene also got the formula wrong, or at least you
didn't get the complete formula for two waves passing in opposite
directions deep in the night. It's doubtful you even know what the kx
in your formula really stands for.

Hello, and while I can't point you to any specific sources I would ask why
you feel you need to use a Cassegranian feed. This complicates the design
in that you need both a parabolic main dish and a hyperbolic reflector.
Have you worked out the antenna's frequency band and required radiation
pattern/gain? Would a non-Cassegrainian feed (e.g. placing the main
radiating/receiving element on a support at the focal point of the
reflector) be viable? Sincerely, and 73s from N4GGO,

What I posted was the equation for a pure standing wave.
What you may be referring to is the omission of the
real world traveling wave component that gets radiated.
Since the radiated component amounts to only about
10% of the wave energy on a standing-wave antenna, it
can be considered to be mostly negligible. The phase
of that small traveling wave is completely swamped
by the 90% wave energy that is in the standing wave
on the 1/4WL standing-wave monopole.

The components of a pure standing wave are two equal
amplitude traveling-waves moving in opposite directions.
Their phasors are equal in magnitude and opposite in
direction of rotation.

What is the phase of the sum of two equal amplitude phasors
moving in opposite directions? Assuming each phasor has an
amplitude of 1.0, here are some points in 1/4WL:

Ifor + Iref = Itot
1.0 at 0 deg + 1.0 at 0 deg = 2.0 at 0 deg
1.0 at -15 deg + 1.0 at +15 deg = 1.9 at 0 deg
1.0 at -30 deg + 1.0 at +30 deg = 1.7 at 0 deg
1.0 at -45 deg + 1.0 at +45 deg = 1.4 at 0 deg
1.0 at -60 deg + 1.0 at +60 deg = 1.0 at 0 deg
1.0 at -75 deg + 1.0 at +75 deg = 0.5 at 0 deg
1.0 at -90 deg + 1.0 at +90 deg = 0.0 at 0 deg

In 90 degrees of wire, the phase of the total
(pure standing wave) current doesn't change.
This makes the phase of the total current on a
standing-wave antenna invalid for measuring
the delay through the wire or through a coil.

Note how the above values roughly correspond
to the current amplitude and phase distribution
on a 1/4WL monopole. From "Antennas" by Kraus:

"It is generally assumed that the current distribution
of a (thin wire dipole) is sinusoidal, and that the
phase is constant over a 1/2WL interval ..."

All illustrated on page 464 of the 3rd edition.

Have you tried asking manufacturers like Micro-Coax who their stocking distributors are? One of the distributors may take pity on you and sell you a small quantity. You _might_ even be able to sweet-talk a manufacturer/rep out of a sample of 3 feet of the stuff.

Cheers,
Tom

It's easy to say someone is wrong - why don't you
post the correct equation so we can discuss it?

Whether the (kx) term is a sine or cosine is a
function of where x=0. Whether the (wt) term
is a sine or cosine function is arbitrary.

Hecht in "Optics" uses this equation for a pure
standing wave:

E(x,t) = 2Eo1*sin(kx)*cos(wt)

Ramo and Whinnery write it a little differently:

E(z,t) = 2E+*sin(kz)*sin(wt)

My definition of Eo in my previous equation is
Eo = |E+|+|E-| = 2Eo1 = 2E+

E(x,t) = Eo*cos(kx)*cos(wt)

I fail to see anything wrong with that equation
for a pure standing wave.

Almost all the distributors are willing to sell short lengths with
an added flat, short length, cutting fee ranging from $15 to $25,
which at the price of this stuff may be the way to go.

In the past, Cecil, I've learned that trying to discuss anything with you has been a complete waste of time. There's no discussing anything with someone who makes things up in his head, cherry picks phrases from authorities to justify his fantasies, and then doggedly keeps repeating himself - without understanding, by the way - not in an effort to promote whatever truth that may lie in his assumptions, but to always, and perpetually, and dogmatically crush all doubts about the wisdom of his assertions by other people. If you would spend anywhere near the time studying your subject as you do defending it, you might even have something intelligent to say about it, in which case, your posts might even be worth reading. In the meantime, they are mere cheap red wine: plonk.

Hi Emanuele,

This is probably due to the way the question was offered. You want a
complete solution to an unknown problem. When such "wish lists" are
posted here, they obtain one of several results:
1. An exhaustive reply that is complete to the question asked, but we
then have the luxury of reading from the original poster that "that
specific solution won't work because...."
2. The beginning of an exhaustive series of postings to draw the
specific issues out of the original poster. That has already begun by
another poster in this thread.
3. The fire hose is opened (much as above) which is another form of
(2) in that you imply you have done a google search, but you haven't
expressed what your search terms were - which would, of course, reduce
those 60,400 links to something more tractable. You don't offer
anything like this in your response except outrage.

Each of these possible outcomes inevitable returns to you, and
something you could have done first instead of last: What is your
problem, why do you think this (a "cassegrain antenna") is the
solution, and some fundamental design issues such as
1. Frequency;
2. Bandwidth;
3. Match;
4. Gain;
5. Budget (time and/or money);
6. Specific issues (phase control?);
7. Application issues (EME?).

When such things are asked for, students coming here to complete an
homework assignment are usually stunned. If you are not a student,
then an engineer is always prepared to submit the characteristics
required. If you are not a student, nor an engineer, then almost any
quick answer could lead you down the path to lost time. You are lucky
no one supplied that quick answer, because we have enough miracle
antenna designers who come here to do just that.

I made a helical end fed antenna that is inside a cone shaped
reflector
The reflector is made from 1/2" mesh steel with an aluminum foil liner
and connected to the braid of the feed coax. No baluns are used, just
direct connections.
I was surprised to hear signals from the rear!
I thought that a dish reflector prevented such signals getting to the
receiver. So what can be wrong with the reflector or can signals get
reflected back from the frontal area? Antenna is at a 40 foot height
Any ideas as to what the fault could be?
Regards
Art
I have no experience with dishes thus the question Note, the helical
antenna does not protrude beyond the dish envelope.

Diffraction off the edge of the reflector. It causes backlobes. It's
not a fault.

Hi to everyone and thanks for answering to my message.

Richard Clark ha scritto:
> Hi Emanuele,
>
> This is probably due to the way the question was offered. You want a
> complete solution to an unknown problem.

You and Dave were right. I originally posted the message in the homebrew newsgroup because I was looking for a complete guide to design a cas in order to build a little radiometer working in the "water hole" (1420 ~ 1640 MHz) for an hobbystic aim.
The book I used at university to study antennas - Antennas and Radiowave Propagation [by Robert E. Collin] - simply doesn't cover in depth this argument. It just cites the Cassegrain feed system as an alternative to prime focus paraboloidal reflector antennas, because the cassegrain feed does't receive the thermal noise from the ground.

I was looking for a complete resource to study the system, and this is why I wrote here: to find someone with good advices.

Now, the thing I have now understood is that I haven't to be so synthetic while writing a message.

So, I would like to study (and eventually build) a radiometer who listens to 1420 ~ 1640 MHz, with a passing bandwidth of 8 MHz, in order to receive a minumum density flux of 240-260 Jy (a Jansky is 10^-26 W / [m^2 * Hz]). I need low antenna temperature (but not as cryogenics ones!).

> 5. Budget (time and/or money);

I can't answer this question yet. Surely, I haven't more than 5-600 euros to spend in the building/buying of the antenna.

> 6. Specific issues (phase control?);

Nothing special: I would like an output signal proportional to the power of the radiation picked up.

> 7. Application issues (EME?).

Amateur radioastronomy.

Well, that's all by the moment.

The radiator is totally within the reflector envelope !
It is possible that the transmission line is picking up
some signal but a brief scan of the books show that
dishes do some how obtain some signals from the rear..
"Ignoring the obvious" is a nonsense aproach,
as is scale and wavelength.
I was hoping for somebody who is familiar with dish design
and not from one who is a talking head bent on agitation
and slander

There is a lot of very important information missing here.
What frequency are we talking about and what is the dish diameter?
Do you have any idea as to what your edge taper is or sidelobes?

The last time he talked about it, it was "designed" to operate on the
160 meter band and the "reflector" was 3 meters in diameter.

No, those numbers are not typos.

Dale
I thought that if the radiator was in the reflector envelope, that is
the radiator is below the top of the cone then there should be no
radiation from the rear though possibly a little edge refraction. I
know little regarding dish reflectors thus the question. I am of the
opinion that radio is a matter of particles and not waves so I can
easily visualize impregnation of the shield at the center as per
Rutherford foil and particle experiments, but I am not ready to jump
because of edge taper and other things that I am not aware of
What is very clear from dish radiation patterns in the books that
there is a localised radiation congregation at the dish axis rear
which appears unexplainable.
at the rear at the dishes axis tho it is in the area of direct impact
I appreciate the comments and thoughts applied but not the nonsensicle
writings of Richard who is wired so differently from the rest of us.
These signals appear at all frequencies though I fail to see what the
impact of frequency is because of the reflector envelope or umbrella.

Dale

You will, of course, have noted that he hasn't given a couple of the
important items that you requested. Based upon some of his earlier
babblings, I suspect that this is a helical antenna of perhaps UHF
dimensions that he is attempting to use on 160 or 80.

This is a curious defense of poor practice. The results fully follow
the obvious problem of ignoring scale and wavelength. Fundamentals
have been violated - it doesn't take a PhD nor a research grant to
figure that out. No models are necessary, but they would show the
failure too.

Hi Ian,

What has been done right is arguable in the face of failure. The
simple testimony easily reveals very simple problems of a fundamental
nature.

Hoisting the design 40 feet only added to the inefficiency of the
exercise (use common sense before muscles - much in the sense of
"measure twice, cut once").

Hi Brian,

You have hit the nail on the head. More, you have pushed in the tack
with a 10# sledge. This design we are talking about suffers immensely
from the violation of observing what you comment upon.

It is very much a fault.

Hi Emanuele,

I have that book and I can see your source material. If it is your
choice, that is fine. Other correspondents here can respond to your
desire to eliminate thermal noise from the ground in alternative
designs. You may have to repeat your query to get their attention as
this is not a topic that many have experience with (repetition is for
the occasion when they check in on an irregular basis). An
alternative is to search this group, specifically, at
groups.google.com.

You can get a lot of practical ideas here (construction materials and
feed issues); and you can use Collin for the math to simply scale the

structure to your frequency band. The design is rather more simple
than building it.

Rollie
I checked.
The coax ground and the reflector is grounded at the same place at the
top of the tower. All horizontal coax is buried. Seems like the dish
reflector does not get a lot of attention from ham operators !

That antenna was when I used an old parabolic satellite dish which was
unsuitable.
Scanning past antenna papers point to the use of a cone shape similar
to a horn of 2 metres diameter
produces better results. The antenna needs a longer mast so at the
moment I can't compare
F/R. Either way, with the radiator within the reflector envelope it is

difficult to understand what creates
a rearward lobe regardles of scale or frequency of use with respect to
receive. At the moment I see nothing that points away from the
Rutherford particle experiments with foil .ie penetration when at
right angles , deflection at other angles.

Ian;
I specifically mentioned the absence of a balun. I stated that since
it doesn't seem relevent, especially when one reviews published
patterns. In a way I knew that Richard would pile up his postings of
olde english prose in the shape of riddles that provide nothing, But
one has to get used to him and his pals kb9....and others who smear
this group with a foul smell as they are wired very differently from
the rest of us.

As usual Art you are avoiding answering the questions and choose to confuse the issues
with you own preconceived ideas and terminology. The fact that the feed is totally within the "reflector envelope" tells you or us nothing about sidelobes and edge taper.
I really don't think you want answers, but I'll try once more:
1. What frequency
2. What is the dish diameter
3. What is the dish focal length to diameter ratio (F/D)

I am not avoiding questions, just those that appear irrelevant, but
here goes Anything to make you happy, this should be interesting how
you use these answers with respect to the posted question

1 160 metres upto 2 metres, tunable

2 2 metres

3 Doesn't have a focal length, it is an end fed (series connection)
helix antenna.

At least to the best of my knowledge which is why I posed the question
Hopefully we will all stay on subject and not get side tracked. I will
leave it to others to respond to Richard when they determine what he
is talking about.

20 postings to get to the point (not unanticipated, however) which Art
calls "irrelevant."

As for those answers?
>1 160 metres upto 2 metres, tunable

>2 2 metres
Hence the wholesale disregard for first principles in size vs.
wavelength. Elementary analysis need not go any further when failure
is so obviously designed in.

>3 Doesn't have a focal length, it is an end fed (series connection)
>helix antenna.
-Well, maybe not obvious to everyone.-

But why don't we chalk this design up to S U C C E S S and call it a
thread? If this bier gets anymore wreaths tossed onto it, it will
kill the pallbearers.

The posting is about dishes not antennas. I have not read about a dish
that does not emit signals to the rear. Now I have built one and find
to my surprize that it does accept signals from the rear ! All very
simple, the radiator is resting at the bottom of a cone and the top of
the radiator does not stick out beyond the reflector. Since you do not
know what you are talking about and intent is to disrupt this thread
why on earth are you muttering about nothing at length? Simple
question has been posed and obviously you do not know the answers that
antenna engineering knowledge would provide as you are not an engineer
but a actor or actress by day and by night. My question remains

unanswered after all these posts.How do signals arrive or depart from the rear of a dish or horn? We all know that you don't know the answer but there are qualified engineers in this group who possibly doand willing to share.

Your antenna has nothing to do with dish antennas, bu rather plane reflectors (of which yours is way too small as Richard pointed out).
I know we cannot change your opinion or teach you anything- so I am out of here.

Well, to start with Art, a cone reflector doesn't meet the definition of
a dish antenna.

I'm sorry, but they just aren't the same thing.

I surprizzzed you missed the difference.

Oh, I have just popped in and saw Richard up to to his old tricks with
Cecil. I don't really expect a satisfactory answer. All on this group
denied it was possible to expand Gaussian law of statics to the laws
of Maxwell so there is nobody with a real feel with respect to
radiation, and of course it shows! Same goes for the nature of Richard
no matter how he tries to hide things. The KB9 station and his foul
mouth friends are what I was referring to and is why they are pleading
for a moderator for this newsgroup. Not really the type I wish to
associate with. When the group deviate from the question at hand is
when I leave as they all eventually do.
Within the next few hours they will want to ask questions about you
know what to cover their ignorance and Richard will come prancing in
again with his long leg mesh underware acting out a shakespere scene .
A few years on a ship tends to change
how you look at life so that he walks in the snow with his foot prints
in a straight line
so that the torso wobbles and then there is the way that he acts and
speak.
My question is still there and regardles of the number of postings
made I doubt that it will be answered. This newsgroup becomes dull
when radio goes out the window and personal attacks begin so one
really gets what he wishes for when they hang around.

Dale, my response above was with respect to Richard not you, but I did
know you would run eventually. Study the math of Maxwell and Gauss
before you decide to take up teaching.

Tom
I asked the question as I am not personly knowledgable about dish
style reflectors.
I do read a lot and I read a paper once where it was found that a cone
shaped reflector produced increased gain when used with a helix
antenna, so I made one to try it out. Personaly I see it more as a
horn and not as a dish with a radiator at a phase control difference
from the reflector? Either way I do not understand how that I can hear
signals to the rear if the reflector envelope encloses the radiator
thus the question. Note that a helix radiates differently from the
normal dish radiator such that phasing does not enter the design which
is why you see planar dishes or "cups".
Thus questions with respect to reflector diameter are not
pertinentwhen the radiator is enclosed.

Guys
In the absence of a explanation I will provide a possible alternative.
Maxwell added a specific portion to his mathematical laws that refer
to mass and the speed of light thus verifying the existance of
particles. This addition brought statics laws into the radiation
sphere. Rutherford of the UK (Manchester)showed that particles could

piece a foil of gold because of the relative size of the particle with respect to the latice make up of the foil when viewed head on. Thus in the same way a particle or mass ejected at the speed of light from a radiator could possibly pierce a reflector when met head on.
If so this would explain the rear signals. In the case of a radiator that is not enclosed by the envelope of a reflector head on deflection/ interaction is quite possible and well understood and there are designs to avoid it. With respect to dish edges one can see in the radio handbook what happens to a signal grazing a sharp edge, but that seems hard to swallow when hams cling to the idea of radio "waves" when their actions has not been satisfactorily explained with respect to radiation by physicists.
I suggest that you all pick up the Gaussian equations and add the presence of a time varying field such that it is mathematically the same as one of Maxwell's laws ie
look for mass and light speed signatures. We are past the times when one could suppress ideas such as the World is not flat. When you finally arrive at the point of understanding of Maxwell you only then gain an understanding of radiation. With the denial of this mathematical evidence by all you have zero understanding of radiation and therefore redundant.
Bye

Which would, of course, mean that the dish (cone?) antenna?))
radiator?))) is not listening to signals from the back, but those that
have gone all the way around the World to the front to be heard now
with 3dB gain.

Nothing is broken, it is a S U C C E S S. Modern theory has proven
Alfred E Newton right!

You can argue till you're blue in the face, but in the 50+ years in the radio electronics field, both in civilian and military occupations, I have yet to see a single 'particle' [other than dust, perhaps] on any of the many oscilloscopes I've ever used. Conversely I seen countless 'waves'. I'll stick with the time tested term of RADIO WAVES.

I don't see Art's postings except as they're quoted by others. But from what I'm seeing here, it looks like he's done a great experiment which graphically shows that radio waves don't act like particles. More experiments along this line weren't really necessary, since it's been known at least since Hertz's experiments in the 19th century. And anyone who took high school physics and watched the ripples in the ripple tank should be able to immediately predict what Art is describing. But I suppose the experiment and its results might prove enlightening for those readers who didn't take high school physics and who are nearly completely unacquainted with electromagnetics.

How do you know?
The "rear" signals may come from the front side actually, having
been reflected by your neighbours house, or distant mountains,
or anything in between.

It is highly unlikely that Newton would have known Old English which went out of use in the 12th Century, he probably would not have even known Middle English, unless he was a avid reader of Chaucer. Modern English had been in use and developing since the 1500's, and by the time that Newton was postulating his theories in the late 1600's Modern English was that language of the day. However, scientific papers were written in Latin as this gave them a universal coverage amongst the scientific population.

What others have concluded by guessing is not a concern of mine.
Hams with respect to antennas always call for the supporting math as
they decry amateur measurements. The sad thing is that hams are not
familiar with mathematics.
It is quite clear that by adding a time varying field to the law of

statics it becomes proof of the validity of Maxwell'/s lawsand vica versa. Thus the presence of particles is also verufied.
Maxwell laws are based solely on distributed loads where lumped loads are completely avoided yet lumped loads generate electromagnetic fields. What is the explanation of this when Maxwells laws designate that which is required for maximum efficiency? To look like a wave is inmaterial since a particle at rest on a wave only changes amplitude, it does not follow the movement of water.
We then have the knowledge that the sun provides a stream of particles which arrive on Earth, billions of them and of the smallest size of particle known by man and most hams look to the Sun for predictions of dx activity. Why is this so? Maxwells law includes the speed of light with the inclusio,n of mass in his equations so how is this portion of mathematics included in planar forms that are formed around inductive coupling? We know that the weak force is stronger than gravity and is part of Maxwell's laws the same as we know that gravity does not overcome communication,
another recognition of particles as is the application of rotation to particles to maintain straight line projection and where this specific action is part and parcel of Maxwell's laws. Why do you all close your eyes to these known facts? Books of the present day are for making money not the disemination of facts. White papers are accepted if they have enought references to other publishings so dissemination of the truth is obviously not profitable, but plagarism is. And it all starts with the mathematical phenomina where all mathematics of the masters are used to provide the validity of his laws. Like other law's Gauss's law of Statics is also a proof of the validity of Maxwell's laws with respect to radiation and is accepted via mathematics protocol.
What is happening here is the rejection of the mathematical proof by radio hams, for if the validity is established change obviously occurs and change is seen as undesirable, thus the burial of heads in the sand. Yes, this time we will succeed in
our position it determining that the World is flat by denying the mathematics! All of this group is on record of rejecting the mathematics shown by Maxwell and Gauss by refusing to address it such that validity is denied and change does not come about.

Ian
Both you and Roy project to the World that you are both experts with
respect to radiation. You write articles and both have had the
position of magazine advisors so I can assume that you feel you have a
firm grasp in physics or a good collection of books that you can
resort to for answers. The fact that both of you deny the mathematics
given by Gauyss and Maxwell is a constant surprise to me even tho a
mathematics person from MIT showed all the validity Of what I have
stated. Physics books revolve around Maxwell's laws and show many
instances where other laws
contribute to providing validity his and Newton's laws. Now I provide
another instance
where Gauss also provide validity to Maxwell's laws which have been
confirmed by independent sources. Yet Richard with a major in English
decided the mathematics supplied is in error and both of you, with the
masses, followed in lockstep yet both of you have degrees in the
subject at hand! Why is it that nobody with experience in physics has
come forward to prove me wrong ? Why do both of you refuse to provide
supporting evidence? Yes, you can come forward to discuss SWR and
similar things
yet your absence in not proving me in error is some what amasing. Both
of you tell the group why you cannot substantiate the mathematics
supplied with respect to radiation.If your mathematics or physics are
not up to it why not quote independent sources? Your stances are very

similar to when you worked with magazines that fooled the world with respect to antenna gain on behalf of gain to manufactures.
This newsgroup is for the edification and advancement of antenna knowledge to hams and yet both of you are instrumental in hiding the truth and thus have descended to Richard's level in the destruction of advancement in favour of projecting derision in place of knowledge.
Years ago Roy stated he would go to the ends of the Earth to destroy old housewives tails to clarify the science of radio communication but for some reason he cannot, or will not, prove this to be one of the same.
For the others, consult your teachers or professors or others skilled in the art and ask them the one simple question. Does the addition of a time varying field to the arbritary border of Gauss which contain static particles in equilibrium equal to and verify the laws established by Maxwell? Simple straight forward question which is denied by this group without possesion of the required facts that establishes their position.

If you can understand it, it's Modern English.
Here's an example of Anglo Saxon English (Olde English for
Art): "Se halige Andreas him to cwaeth: 'Thine stefne ic gehiere, ac
ic ne wat hwaer thu art.'" Since Art knows "Olde English" he can
translate it for you.
Here's an example of Middle English from Robert Manning of Brunne's,
Handlyng Synne: "Ther were twey men of holy wyl That levyd togedyr
withouten yl, Alone in an ermytage, And as meke as bryd in kage; The
toon men call Eutycyus, The touther hyght Florentius."
(In both examples I substituted 'th' for the old thorn character.)
Hope this helps.

Art has probably been led astray by reading popular accounts of the
wave-particle duality ideas of quantum mechanics. A little reading can
be a dangerous thing.

Well, I've never been able to understand "The Bible"
so it must not be Modern English. :-) I've heard
that particular English called the "King's English".
Is that an accurate description?

I have re-translated "The Bible". It starts out:
"In the beginning, God created the Big Bang, which
caused time to stand relatively still because all
particles were moving at nearly the speed of light."

Off-topic question: Should we stone adulterers or
not? :-)

If one expects a wave, one will measure a wave.
If one expects a particle, one will measure a particle.
Do human expectations dictate reality or vice versa?

Tom
If you have read a lot or have physics instruction step forward and
provide the mathematics of Gauss law of static particles with the
addition of a time varying field.
Deeds are more powerfull than words, prove me in error and be a herio

You are absolutely correct. Time and modern instruments has proved it
so.
Now we have to retrain the thinking of old people that resist change.
But all we have at hand are people that are old and unskilled in the
arts.

Cecil, I posted this same stuff on the qrz antenna forum which is
followed by the majority of hams around the World. It is now close to
the 4000 hits mark , I find it interesting the difference in thinking
between the different news groups where only a few can manipulate the
whole to attack.

I cannot beat Will Roger's advice: "Be sure you are
right, and then go on ahead."

For instance, I'm absolutely sure I am right about
the delay through a 75m bugcatcher loading coil
which I have actually measured on the bench.

Don't send 73s to me!
I am married with children and have no inclination to
have people such as you in my friendship group. I am wired differently
from you tho I do suspect there may be others here who are wired the
same and willing to follow your direction. You are a troubled man with
endless posts that contain nothing about antennas and only reveal
yourself to others like you exactly who you are, as well as your
needs. Majoring in the english language by suplimentation of the years
spent at sea does nothing to enhance your knowledge of physics. You
are what you appear to be, a fraud that is also wired different from
others in search in those of your own kind that are conditioned to
attack the norm. I suggest you go back to live with your shipmates
again where you were happy and desired.

the simplest form to put in words is: the divergence of E is proportional
to the charge density. the constant of proportionality depends on the units
chosen of course. This is exactly the form used in Maxwell's equations for
time varying fields.

Just words
Supply the math or printed context that support your reasoning with
facts.
All these years of denial without supporting evidence. You couldn't
provide such to
the guy(A doctorate no less) from MIT to convince him he was wrong
either.
David you over estimate your abilities. Richard Harrison who spent his
life with
Radio America finally went back to the books and then apologised for
backing your position because his books backed my position . You
graduated many many years ago and failed to keep up. Now science has
overtaken you. Remember your comment?
Statics has nothing to do with with radiation.
Proof given, nothing other than you said so. And you chose to
follow the wierdo Richard in the attack. And Roy and others followed
in line like lemons. Perhaps you and I should have a talk on top band
where you can verbally deny that I have a rotatable antenna to your
cohorts and where they in the same tone demand more information or
proof.

While this provide some details regarding your antenna, it is not sufficient for me to visualize it.

If one can't visualize what you are talking about, getting help with your questions will be difficult.

You could try a simple experiment: Remove the active part of your antenna and replace it with a dummy load. Leave the reflector/dish/whatever in place. If you still pick up signals, then the antenna itself may not be the problem.

By 'active part', I mean the helix antenna.

You have a web site, a link to a picture would help me understand what you are doing.

You have never debated ! You have only attacked others. If you kept to
antennas
how you are wired would not have mattered as it goes along with the
title of this newsgroup. You could have debated the good Dr from MIT
with respect to mathematics but you chose to insult.He with a
doctorate being denigrated by an english major! No wonder the
technically advantaged don't stay long on this newsgroup
Why not have a debate with Cecil where you can supply facts instead
of attacks in a debate about phase changes with the facts you learned

from Shakesphere, I am sure you learned a lot dressed in those log
legged mesh pants as
you prance around the stage. I thought you were proud of what you are.

unfortunately this media restricts us to words, but any phd worth his salt could reconstruct the equation in symbols from my description. does: "del dot E = rho" make it any clearer? if not, look up page 33 of the 2nd edition of jackson's classical electrodynamics. and then compare that with the statement of maxwell's equations on page 2.

take an aluminum foil dunce cap, wide a curly pigs tail helix inside of it
and feed it with coax. most likely he attached the shield to the foil and
the center conductor to the helix, so all he has is an ugly dipole all
folded up on itself at hf. he would be better off putting the dunce cap
over his head to prevent damage from the brain probes.

Joe
This debate has been going on for years. It is all in the archives. I
am not interested
in hearing the cacophony of sound all over again every time a newcomer
comes along
Believe it or not this thread started with a question and you may have
read the responses. You may not be different from the others and time
would be wasted again.
Read the archives for yourself instead of asking favours of me, it is

all printed in the archives and it goes back half a dozen years or more. If you are a qualified engineer like me it will take only a short time to get to the gist of the material and possibly fall in place with your support. But I will not hold my breath. Note Both previous advisors
of Radcom amateur radio magazine in the UK and also Roy formerly of QST have formally debunked my position in public tho neither has provided proof so you might want to use your time else where
Or maybe hook up with Richard. wink wink !! Either way I am readying to get out of here again these guys are ruthless.
Nothing personal intended

David look up Newtons laws and make note of the mathematics that
dictate the presence of a displacement current is used to impact with
mass at the speed of light.
Find out why Maxwell was impelled to insert it into his formue when he
could not identify or verify the legitimacy of such an insertion. He
was a mathematicion who followed the laws of mathematic which also
follows the laws of Newton.
To check his formula legitimacy he had to place his formula to one
side of the equal sign and prove that the equation equated to zero
(from the universal understanding of
cosmos equilibrium) He found that his formula did not equal zero ! So
what could he do for it to make it zero as required? He decided to
cancel out what metrics that he could and then added the extra
required metrics that would cancel out the remaining metrics. Yup the
final equation equaled zero where his insertion predicted the presence
of the weak force acting on a mass or particle.
It was years before Foucault identified what Maxwell had added and
Einstein never identified the weak force metrics that Maxwell placed
right in front of him.
Now we have antenna computer programs that are based on Maxwells laws
that include displacement current where they are programmed to change
what has been inserted to conform with Maxwells laws(optimisation
programs) and not the pre conceived planar design.
And guess what? They do reject pre conceived ideas such as the Yagi
and other planar designs that depend solely of intermagnetic coupling
and place designs that
are in agreement with Maxwell's laws which include the presence of
particlesfor maximum efficiency of radiation.

Now since the laws of Maxwell drops firmly on the side of particles instead of waves the amateur fraternity feel compelled to discredit computer programs such that there position is maintained and change is not required.
And the World continues to waddle in the garbage by ignoring the accompanying smell. My oh my.
Qudoes to this newsgroup for leading the charge against change

No!

King's (Queen's) English is used to describe 'correct' English, as opposed to slang or poor grammar etc..

The English in the King James Bible is correctly described as Early Modern (or Renaissance) English.

*** Exordium ***
My dear Artifice, knowing your attachment to the practices of time out of mind as indulged by the hooded monks whipping religion into their young charges; I took a special effort to prepare you a debate with it demarked by the classic degrees that you will note in *** stars ***

*** accumulatio ***
>I have no experience with dishes
This is our first clue which you then elaborate with:
>Rutherford of the UK (Manchester)showed that particles could
>piece a foil of gold
Your dish is of inferior craftmanship in that it is certainly not gold:
>The reflector is made from 1/2" mesh steel with an aluminum foil liner

*** Narratio ***
One would note that there is a world of antennas made with neither gold, nor aluminum (isn't it aluminium?) foil, but thinner metal foil on mylar or plastic. They work fine and do not suffer failure such as yours. It would seem they are Rutherford partical resistant and do not conform to your theory of a weekend farce. This is no surprise as Margaret Rutherford was an English actress who played in the flamboyant Oscar Wilde's "The Importance of Being Earnest." Your work, as disappointing as it is does qualify as being earnest.

*** Divisio ***
However, one must observe the cautionary tale that inhabits that more important (than your) work of Wilde's:

Jack - My dear Algy, you talk exactly as if you were a dentist.
It is very vulgar to talk like a dentist when one isn't a dentist.
It produces a false impression.

One could insert "antenna designer" for "dentist" to the same effect.
As for your fond attachment to Margaret Rutherford, let us take a leaf from the script where she appears in full character of Miss prism:

Lady Bracknell - Is this Miss prism a female of repellent aspect, remotely connected with education? It contained the manuscript of a three-volume novel of more than usually revolting sentimentality.

Miss prism - [grows pale and quails. She looks anxiously round as if desirous to escape.]

*** Confirmatio ***
Let's see, Oscar Wilde wrote this at the end of the 19th century,

where much of your reading has been stalled in arrested development.
There is a reference to large written works (three volumes). The
implication being offered is such rambling work can be easily summed
up as the usually revolting sentimentality. And it is all brought
together in the character played by Margaret Rutherford. It shouldn't
take a leap of intelligence to note her character name of prism, and
the work done with prisms by Newton.

*** Peroratio ***
> I was surprised to hear signals from the rear!

Lady Bracknell - This noise is extremely unpleasant.
It sounds as if he was having an argument.
I dislike arguments of any kind.
They are always vulgar, and often convincing.

How can one couple this ?
A coaxcable with a dummyload: runningwaves everywhere and U and I are in phase.
Now the resonant dipole: the U peaks at the ends end I tops in the midle. So very reactive for the driver. Should be. Now the dipole is coupled at the coax instead of the 'inphase' load
and, oh wonder, the coax cable doesn't notice the difference ?? The mind boggles.

Nope, you are confused, at least about resonant standing
wave antennas like the 1/2WL dipole. Those peaks and nodes
of the voltage and current are *AMPLITUDES*. Amplitudes have
nothing to do with reactance. To detect the reactance, one
must look at the *PHASE*. You are not looking at the phase.

Instead of looking at the amplitudes of the voltage and
current, take a look at the phase of the voltage and current.
The phase angle which determines the reactance is the difference
between the voltage phase angle and the current phase angle.

Hint: The phase angles of the standing waves on a standing wave
antenna (like a 1/2WL dipole) don't change over the entire
length of the 1/2WL dipole. The standing wave is approximately
90% of the total wave on a 1/2WL dipole so the phase angle
of the total wave on the antenna changes very little from
end to end.

> Should be. Now the dipole is coupled at the coax instead
> of the 'inphase' load
> and, oh wonder, the coax cable doesn't notice the difference ?? The
> mind boggles.

At the antenna feedpoint, for a resonant antenna, the total
current and total voltage are in phase so the resulting
impedance is *purely resistive, not reactive*.

There is a forward wave at the feedpoint which, in a 1/2WL
dipole, travels to the end of the antenna and is reflected.
At the reflection point, the forward voltage and reflected
voltage do not undergo a phase shift but the forward current
and reflected current are 180 degrees out of phase at the
reflection point.

Bottom line is that the reflection phasor adds to the forward
phasor after a 180 degree round trip. In a 1/2WL dipole, Vfor
is 180 degrees out of phase with Vref and Ifor is in phase with
Iref. Assuming a zero degree reference, Vfor is at zero degrees

and Vref is at 180 degrees. Ifor and Iref are both at zero
degrees. Since everything is in phase or 180 degrees out of
phase, we don't need any trig. The feedpoint impedance of a
resonant 1/2WL dipole becomes a *magnitude only* calculation:

1/2WL Zfp = (Vfor-Vref)/(Ifor+Iref)

The negative sign on Vref takes care of the 180 degree phase
shift. The feedpoint impedance of a resonant one wavelength
dipole is also a *magnitude only* calculation but the signs
of the magnitudes change because of the extra 180 degree delay:

1WL Zfp = (Vfor+Vref)/(Ifor-Iref)

It's easy to see why the feedpoint impedance of a 1WL dipole
is so much higher than it is for a 1/2WL dipole. The reflected
voltage and current are delayed by an additional 180 degrees.

Many adulterers are stoned already...

Of course it is a little difficult to figure out just what an adulterer is anyhow. If you raid a neighboring village, you can take the women as slaves and wives, somehow it was okay for Job's daughters to get him drunk and boink him. Go figure...

>for the driver.

I believe you are mistaken here.

A resonant antenna is *defined* by the fact that the voltage and
current are in-phase at each point along the antenna, and thus the
impedance at each point is purely resistive. A resonant antenna does
not present a reactive impedance to the driver.

> Should be.

Isn't.

In a resonant dipole, it's true that the *ratio* of the voltage to
current varies as you move along the antenna from one point to the
next. However, at every point you look, the current (at that point)
and the voltage (at that point) are in phase with one another, and so
the impedance (at that point) is purely resistive.

The fact that the ratio changes, simply means that the impedance is
different (but still resistive).

For example, a resonant dipole (typically just a hair shorter than 1/2
wavelength) in free space has an impedance at the center of around 70
ohms. As you move out towards one end or the other, the impedance
rises... but remains entirely resistive. If you want, you can (for
example) feed such a dipole off-center, with a 300-ohm twinlead or a
450-ohm window line... if you move out far enough from the center
you'll find a point at which the dipole presents an exact match to
such a feedline.

> Now the dipole is coupled at the coax instead
>of the 'inphase' load
>and, oh wonder, the coax cable doesn't notice the difference ?? The
>mind boggles.

Only because you have an incorrect assumption here. The fact that the
amplitudes of the voltage and current vary in different directions
as you move out from the center (voltage increases and current
decreases) doesn't mean that the voltage and current waveforms at any

given point are out of phase... they aren't.

2142. Variable phasing vs 4-square

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-13 21:18:54 UTC
From: Bill Ogden <billogden@optonline.net>
Message-ID: <49e3abcf$0$5922$607ed4bc@cv.net>
Source record: 16466

I am trying to understand the practical differences as a receiving antenna between (1) two "active" verticals with a variable phasing control, and (2) four "active" verticals with a switch for four different directions. My interest is mostly for 80 meters. The physical differences are obvious, of course. This is mostly in regards to the two different DX Engineering products.

Is there a significant improvement using the four-square version? Lower noise? Lower angles? Tighter "beam"?

You can't translate something you don't read or understand. The media often
does something like that, it is called "commentary" or roughly translated:
"subterfuge", "lying" or "manipulation" depending on the intent.

BTW look to John Chapter 8. Seemingly the law is clear but condemnation
isn't required.

>great wizard from MIT took off, never to be heard from again.

Hi Mark,

Just to balance this (and it is like trying to balance a stack of crystal champagne glasses on a trampoline), Art's MIT galahad wandered into the word game of Art's. The term Gauss' Law exists in the math of Maxwell's equations (and Art will probably stop reading at this observation to crow vindication).

Maxwell took the static law of Gauss and applied a time variable (what Art claims is his own invention) AND then Maxwell named his elaborated mathematics "Gauss' Law."

Our MIT galahad jumped ship when I pointed out that his own reference made this same point in terminology and described its derivation exactly as I have above. To give credit to the unfortunate galahad, Maxwell's form of "Gauss' Law" is perfectly good math (duh), and what Art describes is close enough if you ignore his juvenile chest thumping over his intellectual property rights (dick waving).

We have since seen this word salad Art's offered garnished with particals seasoned with a weekend farce.

Bill, I am curious if you are aware of ON4UN's Low Band Dx-ing book ? It is considered to be the bible of low band dx-ing, especially for 160 and 80 meters. The author is the "King" of 80 meter dx work. Just google ON4UN, and you will get the info for the book.

Chap 11 is about "vertical arrays."

I am not an expert, but I have just directed you to the top one on this subject.

Good luck !!

I understand "electric field strength" at a point, but I need a little help with "voltage at a point (along the antenna conductor, presumably). Voltage relative to what? Measured along what path? It's usually pretty easy to get agreement about voltage at a feedpoint, but things are much less clear away from that.

In any event, the only thing that matters with respect to the load on a feedline is the impedance (that is, voltage divided by current) at the feedpoint; the current at other points in the antenna does not need to be in phase with that feedpoint current to yield a purely resistive feedpoint impedance.

Cheers,
Tom

It indeed "does not need to be in phase with that
feedpoint current" but EZNEC says it is pretty
close to being in phase.

Here are the currents in 10 segments of a 1/4WL
monopole. The current phase varies by only 2.62
degrees in 90 degrees of antenna.

Arts design is not origonal, it was around in the 60s and 70s as a CB
radio joke. It rated up there along with burying a dipole a 1/4 wl
deep in the ground.. Unlike the buried antenna this joke was
especially good because sometimes it wold work just well enough to
work some skip and then you would hear the guy talking about this
great antenna he had

I was sure I was right and then made the measurements
that proved it. The established laws of physics don't
require additional measurements. Have you proved
Maxwell's equations lately?

When one needs to delay a signal, one can install a
coil to accomplish that need. Why is it so hard to
accept that coils cause delays?

What would be the difference in the amount of time it takes a pulse to travel from feedpoint and be reflected back to the feed point comparing a 1/4 wl 40 meter antenna to a 15ft loaded antenna center loaded to resonate at 40 meters?

Please don't confuse delay (amount of time) with the
total phase shift. There is a point in a loading coil
antenna where the phase shift is instantaneous.

The total phase shift is *exactly* the same assuming
both antennas are resonant on 40m. How could it possibly
be otherwise?

If you had any idea of what you were talking about,
you would know that the total phase shift is unrelated
to the total delay. Some incremental phase shifts are
related to the velocity factor. Some incremental phase
shifts are instantaneous. If you don't already know
that, you don't know how to use a Smith Chart.

Exceedingly profound. Is there a third, unpublished, cosine parameter
(Suppressed Hypothetical Interval Term) for delay that is not phase
nor position? This must be another one of Cecil's "you are right, but
you are wrong about what you thought you were thinking about."

Right. I suspect it was because Cecil was wrong about what he thought I
was thinking about. Again. Either that, or he was referring to
standing waves of current that 'begin undulating linearly & laterally'
at a 'cosinusoidal reduced amplitude phase'.

A bit more about this...

If you model a center-fed dipole made of thin wire (say wire diameter about 1/1000 of a wavelength) at half-wave resonance, you should see that the current toward the ends of the wire lags the current at the center by a few degrees. If you increase the wire diameter (to say 1/100 of a wavelength) and model at (the new) resonance, you should see that the current toward the ends of the wire lags the current at the center by considerably more than with the thin wire, perhaps about double the lag. In both cases, the feedpoint impedance is by definition nonreactive.

Now if you model each of these antennas at an operating frequency 90% of the half-wave-resonant frequency, you should see that the phase at the ends of the wire lags by much less than it did at resonance, but now the feedpoint impedance is quite reactive: the reactance should be considerably more than the resistance in the case of the thin wire antenna, and the resistance and reactance should be similar in the case of the thicker wire.

Enlighten yourself further by modelling these two antennas fed at frequencies near full wave resonance and near the resonance associated with 1.5 waves antenna length. You will see that the phase along the wire changes considerably more than when the antenna is operated at or near half-wave resonance, but that the frequency can be adjusted so that the feedpoint impedance is non-reactive. You'll also notice, if your model has divided the wire into enough segments, that the phase along the wire does not change abruptly as you pass through a current node or antinode.

The conclusion I draw is that it's fruitless to worry about the phase of the current along the wire when you're considering the feedpoint impedance. It may be very interesting to consider the phase of the current on the wire for other reasons, but not for the reason of adjusting the feedpoint impedance.

Cheers,
Tom

I guess I should provide a context for the uninitiated.

If the system contains only traveling waves, the delay
is proportional to the phase shift. If the system contains
only standing waves, the delay is completely unrelated to
the phase shift since the phase shift is always zero over
any 1/2WL between the current nodes. EZNEC supports that
fact and w7el has admitted such in a previous posting.

Kraus and Balanis both agree with the above assertion. I
believe that you are aware of that fact so I have no choice
but to assume that you are deliberately trying to hoodwink
the uninitiated as are w7el and w8ji. Your ulterior motives
remain unclear to me since you will not doubt be proven
technically wrong at some point. You guys cannot possibly
plead ignorance after all these years of discussion.

Traveling wave current changes phase relative to the source
current. Every technical person agrees on that fact of physics.

Standing wave current does not change phase relative to
the source current. Everyone technical person agrees on
that fact of physics.

Therefore, standing wave current phase cannot be used to
measure delay through a wire or through a coil. This is
such a simple concept that any disagreement must be
considered to be a conspiracy to hoodwink the uninitiated.
Exactly what do you guys have to gain from hoodwinking
the unwashed masses???

Any good antenna book will present the equations for voltage
and current on a lossless thin-wire dipole. Those equations
disagree with your conclusions.

I'm surprised they ever used EZNEC, or discussed systems that have
standing waves, and nothing else.

> Standing wave current does not change phase relative to
> the source current. Everyone technical person agrees on
> that fact of physics.

Yes, and that's by virtue of the fact that standing waves are entirely
dependent on traveling waves. In fact, standing waves don't do anything
on their own.

What's amazing is that you continue to insist on attributing
interference with supernatural powers - "redistribution"
being one, "delaying" itself apparently being another.

> Therefore, standing wave current phase cannot be used to
> measure delay through a wire or through a coil.

We've seen how you can calculate it. So, given that phase and delay are
completely unrelated as you have explained, please describe if you would
how one would go about actually measuring standing wave current delay -
whatever that is.

I'm not surprised because you have obviously never cracked
open their books - tsk, tsk. Reference page 288 of "Optics",
by Hecht, 4th edition, 7.1.4 Standing Waves.

> What's amazing is that you continue to insist on attributing
> interference with supernatural powers - "redistribution"
> being one, ...

Obviously, you have never read the following FSU web page:

micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveinteractions/index.html

"... when two waves of equal amplitude and wavelength that are
180-degrees ... out of phase with each other meet, they are not
actually annihilated, ... All of the photon energy present in
these waves must somehow be recovered or *redistributed* in a
new direction, according to the law of energy conservation ...
Instead, upon meeting, the photons are *redistributed* to regions
that permit constructive interference, so the effect should be
considered as a *redistribution* of light waves and photon energy
rather than the spontaneous construction or destruction of light."

Exactly what is it about the *redistribution* of energy that you
don't understand?

> ... please describe if you would
> how one would go about actually measuring standing wave current delay -
> whatever that is.

I cannot improve on Hecht's words in "Optics":

"This is the equation for a STANDING or STATIONARY WAVE, as
opposed to a traveling wave. Its profile does not move through
space; ... It doesn't rotate at all, and the resultant wave
it represents doesn't progress through space - its a standing
wave."

In other words, "standing wave current delay" does not exist.
Only an ignorant fool would think that it could exist given
the equation for a standing wave. Yet this is the current
that w7el and w8ji tried to use to measure the delay through
a 75m mobile loading coil.

> The suggestion sounds a little nutty to me, to be honest. Is it
> possible that you might be mistaken about any of this?

I could be mistaken about your ulterior motive but it is hard
for me to accept the fact that you guys are just dumb as a stump.
I would rather think that you, w7el, and w8ji have a modicum
of intelligence and are merely engaged in a conspiracy to
hoodwink the uninitiated. Your motive for such is unclear.

Funny you should mention it, that was on TV this past weekend. A true classic.

"Darling, could you loofah my stretch marks?" I still cringe during that part.

On the topic:

When I was a little kid, 9 or 10 I think, I had an old cathedral radio that had shortwave on it. Found it in the attic.

I wanted to experiment with antennas. First I put the typical short straight wire on it. Then I saw a science book that had a big dish antenna on it.

I thought "Wow - if this thing can hear signals from satellites millions of miles out in space, imagine what it can do with those shortwave signals.

So I made a little dish antenna out of copper wire and aluminum foil, around a foot in diameter, and put it on top of the radio. It worked, kinda. Continuing to learn, I found what a longwire antenna could do for performance.

Point is, some 40 years later, I see something sort of like what I did as a 9 year old kid being talked about again. I suspect it will work just about as well now as it did then. Which is to say - not very well.

I had an excuse though.

> 73, Cecil, IEEE, OOTC, http://www.w5dxp.com

Not meaningless and irrelevant. The law is to be considered and respected, but is not the main point. The Jews asked for the law because they were too afraid of the voice of God. Obedience to his voice would have been more pleasing. God seems to be in tune with what we need but there is no way we are going to get in the way of His plans. Jesus was the right hand of God reaching out to us. If that doesn't strike you with awe, and it is all meaningless to you, then you have no heart and morality is what you make up just like the animals. Essentially a "heathen".

And you wonder why children who have been taught they are no more than "evolved primordial soup" go to school with "Natural Selection" T-shirts and kill as many as they can for sport. And why abortion is being promoted as a painless way to make genocide acceptable. I pray America and its people finds their way back to God before He sends his blessing elsewhere.

As far as Newton's theory... I thought he dealt primarily with forces. Works well with things like magnetism, gravity and mechanics, but when you introduce AC and antenna theory, it becomes very complex and the pages start to fill with Math. Not easy to explain in a news post. I have yet to see any of the Math in these posts, which speaks to the fact that everyone is too lazy to do more than talk about it.

The voices are wrong, it doesnt take a lot of digging to find out who
I am if you really want to know, Ive been here for years. I just dont
like my identity plastered on newsgroups.

Jimmie

Yes, but don't you see? That's the clever deception. You could have
appended three letters to your first name and typed it in all caps,
and then only somebody as smart as Cecil could figure out that you are
actually me. Not even we would know it. :-)

As have w7el and w8ji. All their measurements proved
is that standing wave current doesn't change phase
relative to the feedpoint current phase. They did
not measure the delay through a coil. They measured
the phase shift through the coil using a current that
doesn't change phase relative to the two measurement
points. The same thing happens with a wire.

To measure the actual delay through a coil, traveling
wave current must be used. I am apparently the only
one who ran that actual experiment. I guarantee if
anyone performs that experiment in a valid manner,
they will see similar results to mine. Here's the
setup that I used to measure a ~25 nS delay through
a 75m bugcatcher coil at 4 MHz.

http://www.w5dxp.com/coiltest.GIF

You should be able to achieve that setup in your
physics lab.

Did you figure out the Z0 of your coil using the Tesla coil
math, and then just assume there were no standing waves, or did
you prove the absence of standing waves through experiment?

Hi Tom,

There is only the hint of a gejoken experiment. I notice nothing
other than a cartoon, and nothing in the way of instrumentation
described, much less the vaunted "results" (no doubt the final
metaphysical tabulation came from some alchemistry). Certainly no
antenna (nor dish reflector that matter). How it relates to a loaded
short monopole would probably provoke an essay as elaborate as the
coronation oratory for a pope.

Hi Richard,
Cecil has never been too effective when it comes to doing
experiments. When asked to do math, he's even more sunk. I'm surprised
he even managed to do a "gejoken" experiment.

The standing waves don't have to be eliminated,
just reduced until the traveling wave dominates
the waveform. I added 600 ohm non-inductive
resistors in series until the reflections were
negligible and the traveling wave dominated the
waveform.

So why do you have to go to all that trouble when you want to measure traveling wave current, but not when you want to measure traveling wave energy?

When one measures traveling wave energy, one
is measuring an average calculated scalar value
usually forward power minus reflected power or
RMS V*I in a dummy load resistor.

When one is measuring delay, one is measuring
instantaneous traveling wave phase in real time.
Trigger on the zero crossing of the input signal
and measure the delay until the output signal
crosses zero.

That delay measurement doesn't work for standing-
wave current because the zero-crossing on the
input and output occur virtually simultaneously,
i.e. there is no relative phase shift between
input and output or between any two points on a
1/4WL wire monopole.

And this from the cartoonist.

It readily explains how poorly the gejoken experiment started. Let's
see how many yuks it will get through conventional issues

>I used toroidal pickups at the current
>sample points and viewed the current waveforms
>on a 100 MHz dual-trace oscilloscope.

No mention of make, no readings, no pretense at discussion of those
things that contribute to error (and, as such, no need for Cecil to
apologize for being wrong until he is painted into his usual corner).

So, from this sloppiness called
>>anyone performs that experiment in a valid manner,
I suppose I have to fill in the blanks and watch Cecil sputter that it
wasn't like that at ALL!!! The cartoonist is most comfortable in
simple things, certainly; but measurement is best left to
professionals.

>>measure a ~25 nS delay
which is the same as a 40 MHz event, but in some "100 MHz" scopes, and
depending upon a myriad of settings (anyone practiced in the art would
realize how many), signal amplitude being one; that same BW can tumble
to 20 MHz to the unsuspecting user's surprise (Cecil can now react in
mock surprised shock). With a roll-off of 3dB per octave (another
concept that is foreign to digital engineers, such is Cecil's legacy),
phase measurement errors begin to run away. We don't even get the
Sunday comics form of math!

OK, so
>>measure a ~25 nS delay
is so much of a hodge-podge, a place marker, a spit into the wind,
something summoned up for the unwashed so the author could bask in
their awe-shucks. If we were to simply accept it (GASP!), what does
it say of the delay introduction of the
>toroidal pickups at the current sample points

More magik happens here no doubt. I won't ask Cecil what his data is for these items because he doesn't have any (at least until he rummages up the dutch courage to fake it).

And what about the phase issues of the 4000 Ohm resistor (which conveniently snubs what might be found in the rest of the antenna now long discarded such that this becomes an onanistic exercise)? Again, no point in asking for data that doesn't exist (you can't even fake it). Magik abounds because Cecil's best work is cartoonistry, not science, and certainly not rocket science.

So, a very quick enumeration of points any experimenter would have come into the discussion with, rather than trailing behind like a dancing bear with blisters.

But I like gejoken experiments, and Cecil's clowning offers the dovetail to Art's when he isn't here complaining about the nails in his hands. I would give this, maybe, 3 yuks.

Because its not meaningless and irrelavent. Its there to show you why Jesus
had to come. He is the fulfillment of the Law. If He is the fullfillment,
then you have to understand what is in the Law and why He had to fulfill it.
The OT is there to point to Jesus in every book.

Uh, if you read closely, thats a narrative of what took place. Life
happens, good and bad. This is what the Bible is about, the good, the bad,
and the ugly. It has nothing to hide about people and they wrong they do. If
God doesnt jump in and throw down a thunderbolt or two, you think that means
He thinks its ok? Im sorry, but you really dont understand much about God
or the Bible by showing that kind of thinking. Surely youre not that naive.
I think youre just biased, which is ok, but at least admit it.

Sounds like "one" Cecil is shy of experimental horsepower. And for
"energy" yet. Another gejoken experiment where the energy of current
(known) and the energy of voltage (known) has the requirement of
finding the gejoken energy (unknown to Cecil, except as an abstraction
spread out over time and phaseless) squared? Some"one" isn't trying
very hard.

The question wasn't about energy squared. It wasn't about RMS (who
cares? Isn't there a scope sitting nearby?). It wasn't about a dummy
load resistor. But these objections do make a nice list of excuses. I
can well imagine that list will only get longer as the list of
experimental options shrinks into a cerebral vacuum.

We have a lot of things declared as abominations in the bible, we have a lot of things on the OT that condemn people to death also. Considering how some of these things are latched onto by those who would promote themselves as the holy these days, I find it a little amusing. I also see those folks more as Pharisees.

If you want to know my bias, read the Sermon on the Mount. Most of the rest is dross.

Pure heresy! There's no way for you to know whether that is true or
not. You're wasting your time trying to find purpose in religious
scripture. As Alexander Pope wrote in his An Essay on Man: Epistle II:
"Know then thyself, presume not God to scan, The proper study of
mankind is man"

Dangit, Cecil! You managed to scare another one out from under his rock. You know you aren't going to do anything but start an argument when you use logic and reason on a true believer. Christians have been fighting and arguing with each other, and killing each other since before the time of Arius over such things as whether non-Jewish Christians should be circumcised, and whether or not Christ was created by God or eternally co-existent with Him. If you're going to start an eternal religious thread, you can at least discuss why Nature is explainable using differential equations, or why evolution has produced so many religious nuts.

Almost remembering is equally handicapped.

>Only you are capable of measurements.

Hardly, more the point is noting those who are not capable and clearly
demonstrate their ineptitude. I've ushered you through more than a
few of these to then hear your excuses of age, infirmity, poor
reading, and so on. You have the unfortunate circumstance of having
inhabited a binary world where there are only two answers - both
resolvable only to one place in the absence of noise. Ours is an
analog world that copes with noise and error, and what counts in life
is how much error. I enumerated several sources, you respond to none
(a binary choice). You allude to my capability for measurement as I
have measured the error of such scopes as yours and fixed them. You
are simply hoping your scope is within its range of capability and we
have yet to hear any reports of readings that would either confirm or
deny your claim. Well, if you don't provide the data, no one can call
you on a failure, right? Another binary choice that struggles for
breath in an analog world.

Let's look at the -3dB roll-off point and I ask you, how many degrees
of slippage does it represent? 0 and 1 are not competent answers.

>Everyone else in the world sucks.

A typical binary perspective and you are glad to force the choice. The
analog equivalent is some"one" else in the world sucks. It could be
parts-per-billion/million/thousand/hundred - but we can both agree
that rhetorically you've scored your point.

>This from the person who asserts that
>the reflections from non-reflective glass are brighter
>than the surface of the sun.

From your data, from your math, and from your argument. You couldn't
account for the missing energy, so you swept it under the prayer rug
with a mystical chant and abridged readings from your Psalter. Choose

another topic for the same outcome, you've suffered many such technical comparisons.

Richard Clark wrote:
> You are simply hoping your scope
> is within its range of capability ...

Measuring the delay of a 4 MHz RF signal through a device is hardly any different from measuring the delay of a 4 MHz digital square wave. Measuring the time from one zero-crossing to another is virtually a no-brainer. It doesn't take much of a setup to detect the difference between 25nS for the traveling wave current and w8ji's measured 3 nS or w7el's measured undetectabe (faster than light?) phase difference using the total current in a standing wave antenna which is 90% standing wave current.

Please design and run your own perfect experiment for determining the delay of a traveling wave through a 75m bugcatcher coil. I guarantee, if you perform it in a valid manner, it will agree qualitatively with my experiment.

What is it about the phase shift in 90 degrees of monopole that you don't understand?

```

> From your data, from your math, and from your argument.

There was no missing energy. Your superposition of
power was the problem. A three watt wave does not
destructively interfere with a two watt wave to
obtain a one watt result. That was explained to
you years ago when you first made that conceptual
error. The correct power merging equation must
contain an interference term unless the two
interfering waves are 90 degrees out of phase.

Hint: 3w + 2w - 2*SQRT(3w*2w) = 0.101 watts

There's no missing energy!

I don't worship Alexander Pope.
I would agree that we can't judge God. We can't even judge ourselves let
alone properly judge each other. There is better love out there than "just
a piece of skin".

Darwin makes quite a leap from finches to "primordial ooze". Even in the
simplest of life forms an orchestra of machinery sustains the life. If any
piece is missing, the life can't be supported. So to believe that all
sprang up by accident, ready to reproduce from a rock seems to be an
unsupported religious belief in itself. But the Atheist will say this is
proof there is no God and leave it at that. Seems unscientific at best, but
then Hitler, Marx, The Columbine Kids and Manifest Destiny all embraced it.
Who's next?

Cecil
I don't understand what all this sniping is all about but it does
bring up a question from me that you may be able to shed some light
upon.
I modeled a helix antenna and because of this thread I went back to
look at the phasing aspect that I had not paid atention to before now.
The phase change goes from 86 degrees upto 106 degrees. It then
abruptly chamges
to -106 degress and slowly returnes to -086 degrees and then turns
about again to 86 degrees again e.t.c.
Does this have a relationship to slow wave? What is your take on my
modeling?
Many thanks for what time you may give to this
Best rergards
Art

This is all the naive hope of absolute faith (a binary choice) in an instrument where you cannot distinguish between capability and desire. Let's face it. The enumeration of readings, the descriptions of all elements in full is very trivial and within the grasp of any ordinary bench tech. That it is so wholly missing from your discussion means that its revelation would expose a major error of design, or would reveal you are not practiced in the art of analog engineering.

You've had time enough to back-fill your virtual notebook with these details of normal procedure. Their sudden arrival in successive discussion won't have much authenticity.

>What is it about the phase shift in 90 degrees of
>monopole that you don't understand?

You are more flummoxed by the simpler problem of your own instrument's introduction of phase error at the -3dB point. If you cannot reconcile that at the bench, then this navel gazing problem of yours is sterile and pointless.

>> From your data, from your math, and from your argument.
>
>There was no missing energy.

More faith and hoping which culminates in the absurd:

>A three watt wave

This arrives from your fog of memory, a poor device I warned you about in the last post. As I pointed out, same outcome.

Is your apology of age, infirmity, or sloughing accuracy for speed next?

Having scanned the above posting or what ever it is. I have a new
respect for those that hunt for relics with scrip on it and try to
decifer the meaning of such a wierd collection of shapes and scrawls.
Obviously a lot of work and fraustration which is nothing compared to
the disapointment of finally realising the content of the work under
study. Line after line of unrelating words with no connections between
the lines
which is obviously that of a child that faking an adult posture.
Put yourself into the bottle you just finished and hurl yourself out
to sea for the ages.

If what you say is true then why draws every antennabook the voltages like above?
We all know that an amplitude can not be negative in value! So all books are wrong?
And could you keep the answer at amateur levels pls?

Standing wave current creates some strange
illusions like zero current points accompanied
by an abrupt large phase shift on each side
of the current node. If you deal with the
underlying traveling waves instead of the total
component wave, things become a lot clearer.

The abrupt phase change happens every so often
in a standing wave antenna. It is presented for
an EDZ in graph form on page 465, Figure 14-4 of
"Antennas" by Kraus, 3rd edition available for
a few bucks at:

I used to have a fuzz-phrase generator card. It had
three columns of ten words each. One could think
up any three digit number and then read the three
word fuzz-phrase off the card. 123 might result in:

flummoxed simpler problem

343 might be:

navel gazing problem

Richard has obviously written a similar computer
program except it seems to have ten columns of
100 words each.

> We all know that an amplitude can not be negative in value!

You would probably agree that the battery voltage
amplitude in your vehicle is +12 volts.

I once had a 1950 Dodge where the amplitude of the
battery voltage was -12 volts.

The instantaneous amplitude of the AC voltage out of
your wall socket at home goes negative every 60 Hz cycle.

So exactly why cannot voltage amplitudes be negative?

Changing the phase of an AC voltage by 180 degrees
changes the amplitude from positive to negative or
from negative to positive. That's what is happening
in the ASCII graphic that you drew.

Our QRP friends would like for you to prove that
a wave cannot deliver 4 joules/sec through a transmission
line to an antenna. That 4 joules/sec can be measured by
a Bird wattmeter installed anywhere on the transmission
line.

Do you think that advertising a 100 milliwatt
laser is false advertising?

Again, exactly where did you get your Electrical
Engineering and/or Physics degrees?

Why not just measure the delay in the instantaneous arrival of energy? That's what pulses generators are for. Or, simply subtract the undesired wave from each measurement. Search on the term 'Thruline' for some tips on how to measure traveling waves.

Flummoxed by a 'wave' which, by all accounts, does not actually exist as such - and yet according to you it can have (or can't have, depending on which post one reads) a phase shift or delay, whichever you prefer, and which (according to you) has actually been quantified (3nS) by others.

It's worthy of a at least a crank.net citation if not a full article in the Journal of Irreproducible Results. :-)

The problem is that it's difficult to put much faith in the measurements you report when you so badly misunderstand and mischaracterize the measurements reported by others. That is the only point of any of this, Art.

> And could you keep the answer at amateur levels pls?

I can't answer for "every antennabook" except to say that any book showing a graph like that and claiming it's a graph of antenna voltage is wrong. As Tom K7ITM recently pointed out, you can't determine a voltage at some point along the wire, as implied by the graph. A voltage only exists *between* two points, and in the the presence of the fields around an antenna, the voltage between two points also depends on the path you take between them -- conceptually, it depends on how you position your meter leads. You *can* find the strength of the E field near various points along the antenna (and it looks pretty much like the graph), but that's not the same as a voltage.

A resonant antenna is one having a feedpoint impedance that's purely resistive, that is, it has no reactance. This impedance is the feedpoint voltage divided by the feedpoint current; the feedpoint voltage is the voltage between the two terminals. The reactance is zero only if the feedpoint voltage and current are exactly in phase, and regardless of their amplitudes.

If the terminals are very far apart in terms of wavelength, you have the same problem in measuring or even defining voltage between them as you do with points along the antenna. So the common definition makes the assumption that the feedpoint terminals are very close together.

Jim,
you were kind enough to state what the point was. Frankly that problem applies to me
because my education was as a mechanical engineer and only a small interest in the electrical stuff as it appeared to be all about mathematics. What I don't understand that the argument and insults are between Americans with the same training at American colleges
(excluding Richard ofcourse who chose literature of olde England)
Both sides should be able to understand what the other is saying! It has been debated in earnest for several years now and all have failed to connect.For my ideas that sort of misunderstanding is obviously my fault and I understand that but it allows Richard to jump in with a lack of knowledge but skilled in insults that are buried like a crossword puzzle and his aproach to the killing fields and which many tend to follow.Most of you are skilled engineers with a firm knowledge of radio and yet most of you talk pass each other on the technical subjects. One side or the other must have an understanding of the problem so why not display it point by point in a reasonable debate so that peace can come about?
Jim, I mean no disrespect in anyway towards you and look forward to your posts but things have to change on this group or its contributions to radio will come to naught.
For me a standing wave is the measurement of disparity between a closed circuit and the period of the frequency in use and nothing more, so all this other talk is beyond my ken
Best regards
Art

Since a standing wave is an interference pattern created by traveling waves, having 'only standing waves' would obviously be an impossible circumstance.

> Traveling wave current changes phase relative to the source
> current.

Yes, especially with distance - but only if it's a source of traveling waves. Evidently there's some chance it could be a source that produces only standing waves. :-)

Nonsense. All it takes is two identical waves traveling in
opposite directions along the same path. Such happens at the
open-circuit or short-circuit point in a 1/4WL stub.

> I urge you to please investigate the mathematical issues associated with
> summing counter-rotating vectors.

I have, Jim. It is you who seems confused. If two coherent
phasors of equal amplitudes and opposite rotations are
phasor-added, the resulting total phase is a constant.

1 at zero deg + 1 at zero deg = 2 at zero deg
1 at 45 deg + 1 at -45 deg = 1.4.4 at zero deg
etc.

> Correct me if I'm wrong, but as far as I know you are the only one
> suggesting that standing wave current phase - whatever that is - could

Nonsense, Jim, standing wave current phase is what EZNEC
reports for a standing-wave antenna.

If you are incapable of comprehending, don't feel bad.
My dog doesn't understand it either but I still love her.

Time to hit the books, Jim. Standing waves are described
in Born and Wolf, section 7.4, pages 297-281, 4th edition.

"We see that at each instant in time the *phase is constant*
through the first medium." The first medium is where the
pure standing waves are. Born and Wolf agree that the phase
of the standing wave doesn't change throughout the medium.
Therefore, its phase cannot be used to measure delay.

The same material is covered in "Optics", by Hecht, section
7.1.4, pages 288-293, 4th edition.

"[Standing wave phase] "*doesn't rotate* at all, and the
resultant wave it represents doesn't progress through space -
its a standing wave."

If you are incapable of understanding that material,
I'm afraid I cannot help you.

> piece is missing, the life can't be supported.

No. There are many processes that make up portions of life forms that are quite complex, yet still function if portions go missing the Blood Clotting cascade is one such example.

The eye has been a poster child of Creationists, yet it is at root a reaction to an energy input. There is a clear progression from simple bacterial to raptor vision (we humans do not have the "best eyes" in creation)

> So to believe that all
> sprang up by accident, ready to reproduce from a rock seems to be an
> unsupported religious belief in itself.

There is a straw man for sure. Life such as it is never sprung from a rock. A lot of things had to happen first.

> But the Atheist will say this is
> proof there is no God and leave it at that.

Straw man again. Atheism is not in any way shape or form a requirement to support the idea that evolution is the method in which life forms adapt to their surroundings. There is no proof that there is no God.

> Seems unscientific at best, but
> then Hitler, Marx, The Columbine Kids and Manifest Destiny all embraced it.
> Who's next?

Good heavens JB!. Could you provide the citations about the Columbine kids views on Evolution? Shame. May they rest in peace.

Hitler was interesting here are a few quotes:

"My feelings as a Christian points me to my Lord and Savior as a fighter."

Munich, 1922

"We are a people of different faiths, but we are one. Which faith conquers the other is not the question; rather, the question is whether Christianity stands or falls.... We tolerate no one in our ranks who attacks the ideas of Christianity... in fact our movement is Christian. We are filled with a desire for Catholics and Protestants to discover one another in the deep distress of our own people."

Passau, 1928

I guess he didn't care for the Sermon on the Mount!

And the roots of Manifest destiny can be traced John Winthrop's "City upon a Hill" sermon in 1630.

If you choose to believe that evolution is false, that is fine, but we are at the point in the argument where the statement is sufficient argument of disbelief. There is too much evidence supporting evolution, and no science disproving it. It takes almost as much faith to not believe in evolution now as it does to believe in a flat earth.

Creationists have unwittingly be one of the greatest forces in research in evolution, as their searching for "faults" in the theory have served as a spur to scientists and research.

Too often, Creationists assume the binary decision, in that anything that is not presently explained by science relating to evolutionary processes means that Evolution is wrong, so the only other choice is Creationism.

But seriously the religious argument can be summed up in a satisfactory manner by saying "I do not believe in evolution, I have faith that God created everything in it's present form." And that is okay. I respect your faith.

But insisting on s literal translation of the two different accounts of creation in Genesis, is just as wrong as the flat earth of four corners, the shape of the world as witnessed by T-O maps, the church's shabby treatment of Bruno and Galileo, and other "threats" to religion, however. The earth rotates around the sun, just as it always has. The truth was in fact no threat at all.

Back to antennas now.......

I don't worry about it Cecil but I am concerned at the number of
people who consider themselves engineers. Remember that nobody on this
group has a true understanding of Maxwells equations! Nobody has
proved Maxwell's laws can be proved by adding a time varing field to
the Gaussian law of Statics. In fact, it is denied by ALL on this
group, Engineers?
That to even try is illegal as well as not being correct! Real
qualified engineers?
And you want this group to understand phase change and travelling
waves without the group coming to a consensus on Maxwell's laws?
Especially when they demand
a definition of equilibrium?
Maxwell;'s laws do not include lumped loads in his equations for
maximum radiation efficiency, so why do hams use lumped loads with
their antennas?
Maxwell;'s laws demand that for maximum efficiency equilibrium must be
kept, yet hams continue to place verticals at right angles to the
earth's surface. And it goes on and on. And engineers continue to
misuse what is known as Maxwell's equations.
However, despite that I do have a honest question Does the TOA of a
dish antenna (CP) change with height similar to other polarisations?
Regards
Art

> Since a standing wave is an interference pattern created by traveling
> waves, having 'only standing waves' would obviously be an impossible
> circumstance.

By "only standing waves", I meant pure standing
waves and nothing else.

We've been through this one before. If the SWR
is 1:1, there is only a forward traveling wave.
If the SWR is not 1:1, there exists a forward
traveling wave and a reverse traveling wave.
If the SWR is infinite, the amplitudes of the
forward wave and reflected wave are equal and
a pure standing wave is the result.

"Only standing waves" doesn't mean the underlying
traveling waves don't exist. It simply means that
the amplitudes of the forward wave and reflected
wave are equal and therefore all of the energy
components in the traveling waves have combined
into the standing waves.

For instance, a lossless stub would contain "only"
standing waves, i.e. pure standing waves.

Those plots are for a *standing-wave antenna*. What you
are missing is that there is no phase shown in those plots.
Pure standing wave voltage and and pure standing wave current
have a constant phase. What you have plotted is a snapshot in
time of voltage and current *amplitude envelopes* in which the
phase is irrelevant. Those plots are not time domain plots.
They are plots of the voltage *envelope* and current *envelope*.

> But in the right side the voltage and current are in
> antiphase, hence my conclusion that

180 degree "antiphase" is still purely resistive with zero
reactance. All that has happened to the voltage is that
the sign of the voltage has changed. It is a snapshot in
time. 1/2 cycle later that same plot would be upside down.

> the antenna must be reactive ! From your explanation at 180
> degrees, why doesn't
> current at the right side flip over then ? Should be.

When all the voltages and currents are either in phase or
180 degrees out of phase, the resulting impedance is purely
resistive. There is *no reactance* in an ideal resonant dipole!

'Pure standing wave' is a more useful term. But there is no
circumstance under which there is "only" a standing wave.

Borrowing from your favorite pro forma rhetorical question: what part of
'interference pattern' don't you understand?

Certainly not true if one knows the device under test
is shorter than one wavelength. I have measured a lot
of voltage circuit delays. I have never measured an
energy delay, whatever that is.

> Just send the coil you would like me to test. I'd be pleased to do it

Here we have an excellent illustration of the kink in your understanding of wave phenomena. Because just as interference does not cause waves to reflect, waves do not make other waves do things, or turn into something else. A standing wave interference pattern is a result of the presence of traveling waves. One does not replace the other.

>> I urge you to please investigate the mathematical issues associated

I you were producing numbers which made sense and were correct, we wouldn't be having this discussion, Cecil. A wave is at various phases along it's length. The phase varies from 0 to 360 every complete cycle. This includes standing waves. Its phase is not "zero" at every point. It's ridiculous to have to point this out to a self proclaimed "expert" on any and every subject such as yourself.

In my experience, incorrect assumptions produce incorrect results. The EZNEC results you refer to are an archetypal example of the effect.

> you.

You obviously don't understand why a signal that doesn't
change phase cannot be used to measure a delay based
on phase shift either through a wire or a coil.

1. Every reference says a pure standing wave does not
change phase.

2. The current on a 75m mobile antenna is at least 90%
standing wave current.

3. Therefore: The phase of the current on a 75m mobile
antenna cannot be used to measure the delay through
the loading coil or even through the straight wire
parts of the antenna.

4. Yet, this is exactly the current that w7el and w8ji
used in their measurements which yielded "no detectable
phase shift" completely unrelated to delay.

Here's a question for you: What is the phase shift
in the current in 90 degrees of an ideal lossless
1/4WL stub? Until you can provide a valid direct
answer to that direct question, you will never
understand.

Certainly not as a function of time. Which means it's not an
alternating current, and which is why it not considered an actual wave.

> 2. The current on a 75m mobile antenna is at least 90%
> standing wave current.

And what's the other 10% supposed to be? Please explain how one would
go about getting "standing wave current" to flow through something -
anything - like a measuring instrument for example.

> 3. Therefore: The phase of the current on a 75m mobile

I'm reminded of the troll at the bridge.

To what phase shift do you refer? With respect to voltage, from one
point to another, out and back - you need to be considerably less
imprecise if you expect someone to bother to answer (to) you.

Exactly what I have been saying for years against some
stiff opposition - welcome aboard.

You missed the point which is: If one parses all the energy
to the standing wave, it cannot separately be parsed to the
traveling waves. Doing so would violate the conservation
of energy principle.

> I you were producing numbers which made sense and were correct, we
> wouldn't be having this discussion, Cecil. A wave is at various phases
> along it's length. The phase varies from 0 to 360 every complete cycle.
> This includes standing waves. Its phase is not "zero" at every point.

You obviously don't understand. Whatever the actual phase
angle is, for a pure standing wave, at any instant of time,
it is constant all up and down the standing wave. NOBODY HAS
EVER SAID IT IS ZERO AT EVERY POINT!!! Such an allegation is
a ridiculous blowing of smoke.

> The
> EZNEC results you refer to are an archetypal example of the effect.

The EZNEC results are what they are and have been confirmed
by w7el himself. All I can say is: Please correct your mistaken
concepts and then rejoin the discussion. What is it about the
following EZNEC results that you don't understand? Do you need
help in comprehending that a 2.71 degree phase shift in 90 degrees
of antenna is a shortfall of 87.29 degrees?

EZNEC+ ver. 4.0
thin-wire 1/4WL vertical 4/17/2009 2:57:42 PM
--------------- CURRENT DATA ---------------
Frequency = 7.29 MHz
Wire No. 1:
Segment Conn Magnitude (A.) Phase (Deg.)
1 Ground 1 0.00
2 .97651 -0.42
3 .93005 -0.83
4 .86159 -1.19
5 .77258 -1.50
6 .66485 -1.78
7 .54059 -2.04

8 .40213 -2.28
9 .25161 -2.50
10 Open .08883 -2.71

If w7el "measures" the phase shift between segment 3
and segment 7, he will "measure" 1.21 degrees. The actual
delay between segment 3 and segment 7 is about 36 degrees.
When will anyone understand that fact of physics?

The other 10% is the traveling wave that gets radiated
of course (neglecting losses).

> Please explain how one would
> go about getting "standing wave current" to flow through something -
> anything - like a measuring instrument for example.

Opps, standing wave current doesn't flow so you must
have meant how does one eliminate reflections so that
nothing except traveling wave current is present.
Do you need that explained to you?

> Have you tried pulsing a current through one? I can't imagine there
> wouldn't be a delay in getting from one end to the other and back.

Exactly, but some would say that's digital, not RF,
or that is not steady-state conditions.

>> 4. Yet, this is exactly the current that w7el and w8ji
>> used in their measurements
>
> No, it is not.

Sorry, you are wrong about that. w7el described in detail
what he had measured and it was "total current" which was
about 90% standing wave current. Here's what he said:

"The result from the second test was a current difference
of 5.4%, again with no measurable phase shift." All using
the total antenna current which is about 90% standing
wave current. What he didn't realize is that a current
difference of 5.4% is a calculated phase shift of ~19
degrees, i.e. ARCCOS(1-.054) = ~19 degrees, to which
you have previously alluded.

>> Here's a question for you: What is the phase shift
>> in the current in 90 degrees of an ideal lossless
>> 1/4WL stub?
>
> I'm reminded of the troll at the bridge.

I'm reminded of people who refuse to answer simple questions.
One wonders why? The answer is zero degrees.

> To what phase shift do you refer? With respect to voltage, from one
> point to another, out and back - you need to be considerably less
> imprecise if you expect someone to bother to answer (to) you.

The context was specified as current. Here is an EZNEC simulation
which should help you.

http://www.w5dxp.com/stub_dip.EZ

Click on currents. You will see that the current phase
varies by ~2 degrees end to end in 90 degrees of stub
just as it does in a 1/4WL monopole over ground.

You claim that W7EL measured the phase shift of standing wave current.
He of course made no such claim. So yes, I need you to explain how it
is possible for someone do measure a "current" that does not flow. This
should be good.

>
> Absurd. Current does not "get radiated".

It's *energy* in the traveling wave that gets radiated.
Less energy indeed lowers the current amplitude.

The Method Of Moments used by NEC assumes the radiated
fields originate from the current in each segment of
the antenna. Current is certainly attenuated by radiation
as it is by dissipation in lossy transmission lines. In
fact, the same attenuation factor is applied to the current
equation as is applied to the voltage equation.

The difference in the forward current vs the reflected
current on the standing-wave antenna at the antenna feedpoint
is due to energy lost to radiation. Radiation from an antenna
indeed does lower the current on the antenna. The conservation
of energy principle strikes again.

You can prove it for yourself by modeling a terminated rhombic
using EZNEC. The current amplitude in the traveling wave
antenna slowly falls as the energy is radiated.

Or put in one amp of 70cm current at one end of 200 feet of
RG-58 and see how much current you get out at the other end.

You don't really think that lumped circuit model assumptions
apply to distributed networks, do you?

> You claim that W7EL measured the phase shift of standing wave current.

My point exactly. w7el "measured" the phase shift in current
that doesn't flow. That was his entire problem. One cannot
measure phase shift in current that doesn't flow, yet that's
exactly what w7el and w8ji reported doing.

Agreed. But when discussing current, one should recognize that, with the exception of "non-flowing current" whatever that is, all currents produce a field. Field cancellation is what prevents the transfer of energy. Any of this sounding familiar to you? The standing wave pattern is useful for illustrating what the field interference pattern might look like.

> w7el "measured" the phase shift in current
> that doesn't flow.

:-) He's good, but he ain't that good. Besides, his meter is the same as yours in that it only responds to waves that travel and currents that flow. The difference I suspect, is in the desired outcome and the rhetoric.

I've said my piece.

I measured current (of which the definition is well understood except apparently by Cecil), and took a lot of care to do it right. Cecil doesn't like the result, so he's created an imaginary quantity he calls "standing wave current" as an attempt to invalidate the results and promote his imaginative theories. Since it's wholly his creation, its properties are free to be modified as the immediate argument requires.

As I, Jim, other posters, and all good texts have explained, a standing wave describes the amplitude envelope of a voltage or current, as a function of position, which results from interference between traveling waves. There's no such thing as "standing wave current". You'll find no references to this fictitious entity in any electromagnetics text.

yes art, electrical engineers, like me, do understand maxwell's equations.
and any of them worth their salt will explain, like i have done many times,
that it is unecessary to add an explicit time variable to the equations
because they are valid at every instant of time... so you end up with
f(t)=f(t) which is redundant and doesn't help with the solution of the
fields and waves. you have admitted that you don't know fields and waves
and that you are not an ee, yet you continue to try to put down those who
show a true understanding of the equations and their underlying assumptions.
you further demonstrate this by talking about lumped impedances in reference
to maxwell's equations and antennas. maxwell's equations describe fields
and waves, not the conductors and elements that generate them. they
reference the currents and fields, not the wires, capacitors, and inductors.
you can derive the properties of inductors and capacitors from maxwell's
equations, but you have to look deep inside them and apply the basic laws
that make up maxwell's equation to describe the lumped elements.

you have yet to explain where equilibrium is required in maxwell's
equations. by definition they rely on non-equilibrium conditions to set up
waves. you can't have a wave while you are in equilibrium, something has to
be putting energy into the system and something has to be moving, that
sounds like non-equilibrium to me.

Indeed.

I measured current, which as everyone with a Novice or higher grade license should know is the rate of flow of charge(*). The charge flows in one direction during each half cycle, and in the other during the other half cycle, resulting in current which is positive for half the cycle and negative for the other. This is known as "alternating current". In fact, my measurement system (ferrite core transformers) will only detect alternating current.

(*)We very commonly, although technically incorrectly, refer to "current flow" when we really mean "charge flow".

Roy is mistaken: Here is what Balanis says in "Antennas":
"The sinusoidal *current* distribution of long open-ended
linear antennas is a *standing wave* ... The *current* and
voltage distributions on open-ended wire antennas are
similar to the *standing wave* patterns on open-ended
transmission lines."

Most good fields and waves textbooks provide the equation for
standing wave current although the equation for standing-wave
voltage is more popular. I certainly did NOT invent the concept.
Why do you think a standing-wave antenna would not contain
standing-wave current?

Roy, here is a public EZNEC support request for you from
a loyal EZNEC customer.

There are 10 segments in a 1/4WL monopole over average ground.
Here is what EZNEC predicts for the currents in each segment.

EZNEC+ ver. 4.0
1/4WL vertical monopole 4/17/2009 6:46:08 PM
--------------- CURRENT DATA ---------------
Frequency = 7.29 MHz
Wire No. 1:
Segment Conn Magnitude (A.) Phase (Deg.)
1 Ground 1 0.00
2 .97651 -0.42
3 .93005 -0.83
4 .86159 -1.19
5 .77258 -1.50
6 .66485 -1.78
7 .54059 -2.04
8 .40213 -2.28
9 .25161 -2.50
10 Open .08883 -2.71

There's about 9 degrees per segment so the number of degrees
between segment 3 and segment 7 is about 36 degrees. If you

put your current probes on segment 3 and segment 7, you will
measure a 1.21 degree phase shift in those 36 degrees of
antenna (just as you did in 36 degrees of loading coil). How
do you explain how to accurately measure the number of degrees
in a wire given EZNEC's numbers? Why do you think a coil is
any different from a straight wire?

> As I, Jim, other posters, and all good texts have explained, a standing
> wave describes the amplitude envelope of a voltage or current, as a
> function of position, which results from interference between traveling

The total current is sometimes parsed into a standing wave plus
a traveling wave. In a standing-wave antenna like a 1/2WL dipole,
the standing wave current is about 90% of the total current while
the traveling wave current is about 10% of the total current.

Total wave = forward traveling wave + reflected traveling wave.

Total wave = standing wave + traveling radiated wave

> There's no such thing as "standing wave current". You'll find no
> references to this fictitious entity in any electromagnetics text.

Absolutely false. In "Fields and Waves in Modern Radio".
by Ramo and Whinnery, 2nd edition, page 42, it gives the equations
for standing wave voltage and standing wave current. The current
equation is: I = (e^jwt/Z0)[Vfor*e^-jbz - Vref*e^+jbz]

Roy, you once verified that the phase of the total current
on a 1/2WL dipole changes by less than 10 degrees over the
entire 180 degree length of antenna. How can you use a current
that changes phase by only 10 degrees in 180 degrees of antenna
to measure the delay along the wire? If you cannot do it along
a wire, what makes you think you can do it through a loading
coil.

For the readers who don't know, Roy absolutely refuses to answer
any of my questions like the above.

Here is a challenge for you, Roy. Set up a short resonant
1/2WL dipole. Install your current pickups 1/3 and 2/3 of
the way from the feedpoint. Obviously that will be 30 degrees
of antenna.

Measure the phase shift between those two points using
the same care as you used with the loading coil.

I'll bet you $100 that you will not measure a 30 degree
phase shift. EZNEC says it will be closer to 3 degrees.

What would be your conclusion if you indeed did measure
3 degrees as EZNEC predicts?

P.S. Would someone please forward this to Roy since he
has Plonked me and refused my emails?

Hello David
I am comfortable that the addition of a time varying field to the laws
of statics is a proof of Maxwell. In fact there are many proofs of
Maxwsells equations if you read your field and waves books Chapter 2
if I recall as well as the appendix. Dr Davis also stated so and
nobody was able to prove him wrong either. So as I have always said I
am comfortable with the proof.

> you further demonstrate this by talking about lumped impedances in reference
> to maxwell's equations and antennas. maxwell's equations describe fields

> that make up maxwell's equation to describe the lumped elements.

Well again I disagree with you. Maxwells laws as far as we are
concerned deals with radiation and maximum efficiency with the basic
of equilibrium. As Newton used the term it was a cosmic law as is all
his laws thus equilibrium or balance is based on the cosmic which
includes outside Earths sphere, a basic for every action and reaction
statement. When you introduce a lumped load into radiation without the
equal and opposite you have violated Maxwell and Newtons laws, very
simple. This is why Maxwell does not include a metric for lumped loads

when calculating maximum efficiency via the boundary method.
Now as far as waves are concerned science recognises that radiation
presents observations that suggest waves but none of these are proven
and I believe that particles dominate which if you go along with
statics laws is also another proof.

>
> you have yet to explain where equilibrium is required in maxwell's

> waves. you can't have a wave while you are in equilibrium, something has to
> be putting energy into the system and something has to be moving, that
> sounds like non-equilibrium to me.

Not so, review the gyroscope action and the sedgewick vehicle all of
which rely on balanced circulating rotation within the cosmos.
But disregard all the things above that you cannot digest. Use a
computer program on antennas that has the option to change human input
so that the laws of Maxwell
are fiollowed implicity. You put in a vertical design and request
maximum gain using the parameters supplied by Maxwell which requires
cosmic balance or equilibrium.
Antenna computer programs will always put aside the planar design as
it lacks equilibrium and will replace it with a tipped vertical
antenna.
So David you have now put your feet into another puzzle by your falure
to digest science. Science and the patent office accept antenna
computer programs output
which is opposite to your thinking so now you are surrounded by a
morass because you denied the good Doctors knowledge of physics.
I accept that that you and others do not have a good understanding of
equilibrium which generates faults in all associated science problems
so our minds will never meet. If you delve into books on Maxwell you
will eventually fall upon the use of Gauss. Since there are so many
proofs available authors shun from showing the Gaussian connection
because of the different metrics involved not because it is not a
viable proof. You have a simple option to prove what is correct, use a
antenna program with an optimiser and determine what a vertical
antenna looks like when seeking maximum efficiency, believe me the
radiator will be tipped. So forget every thing else and show the World
why computer programs produce faulty results when using your logic.
With the use of my logic I have produced a antenna for top band that
is rotatable and directional so something I have done is correct and
computer programs based on Maxwell produce the same results. Go
figure.
Now with respect to a dish antenna with CP. Can the dish supply a
lower TOA than a planar design at the same height?
Regards
Art.
Ps Mechanical engineering requires adherence to equilibrium, it is not
just a electrical thing.I also know little regarding fields and waves
but I am profficient in the application

of fields operating at the speed of light and their impact on
particles for communication
and where impact requires mass.

Never the twain will meet !
What you are debating is the difference between resonance relative to
Earth and that relative to the Cosmos. Thus, according to Einstein, it
is a case of relativity or viewing point. Laws of Newton refer to
equilibrium where all forces are accounted for and balanced thus for
cosmic resonance the "period" or the full wavelength is the true
balance. Thus when dealing with science or the cosmos half a period or
a halfwave
the position is indeterminate. (Simple relativity my dear Watson!)

Hi Calltrex

Now I see your situation. When you want to see the current meter read
plus instead of minus, reverse the leads on the current meter. Then, when
the voltmeter reads plus, the current meter will also read plus.

Laws of science are predicated of our presence in the Universe such as
a single bubble in a bubble bath where pressure contained in a bubble
is different to that of other bubbles. Thus pressure in a single
bubble is analogous to a small part which constitutes the law of
partial pressure.Thus when we on Earth view a half wave as resonant we
have moved away from the concept of the Universe upon which boundary
laws are founded.The concept of a half wave being resonant
is really an approximation of equality in volved in the boundary
aproach similar to the conversion of a three dimensional picture to
that of a two dimension. We see this in a pendulum clock where
friction is used as an equivalent of that which is lost in the change
which is also relative to momentum. We can look at a pendulum clock
and see that this results of showing the effects of equality where
momentum has been manipulated. If a half wave was truly a resonant
point which signifies the completion of one repeatable action we would
expect that the pendulum only swings from top to bottom and back again
by discarding momentum. If the bob of a pendulum is made of a long
length with allowance for movement in three dimensional form we have a
paradox where because of three dimensional movement the pendulum
changes to a circular movement which does not has a repartation of
sequences which signifies accountability because of the Corriolis
effect which is a phenomina of Earth and not the Cosmos. i.e. similar
to the analogy
of partial pressures. Thus, when following the laws of Newton which
follows the nature of the Cosmos, we must take into account the laws
of relativity which is a recognition of change depending on what part
of the Universe that you are viewing things from. This is a
diffinitive metric and not an average metric as viewed by Newton.
Since we are following the laws of the Cosmos(Newton) the metric of
balance must also be that of the Cosmos where true resonance becomes
equal to a period where all forces are accounted for and not that of
half a period.
David, science is a part of nature as is electrical and mechanical and
chemical understanding and not a compentalization of unconnected
sciences. It is for this reason that shows the lack of understanding
of Newtons laws which has mislead the World into using a half period
as a resonant point in communication.

David
Physics is physics, otherwise known as Classical physics
Newton viewed the Cosmos from the outside in, and Einstein
viewed the Cosmos from the inside out. Einstein took this approach
to science because of his inability to locate the "weak force". But
the object of his examination was the same as Newtons, the Cosmos as a
whole. Gauss's approach to statics is the same as Newton, Maxwell and
others. He used the boundary method except using only two dimensions
and not three which requires the dimension of time.
Use of the three dimensions was to check the work of other
scientists that he used in his equations where some of the equations
were two dimensional and required the
other dimension addition of time for equilibrium per Newton's
requirements.
Since you have placed "electricity" in a separate compartment from
that of science you can never fully understand the laws of science so
I will leave the subject in a static position with respect to this
group. I will however leave you with some thoughts to ponder.
Vibration is resonance in terms of our Earth since it does not account
for all forces involved in the Universe which requires balance or
equilibrium.
In other words a sine curve is a graphic(scope) that shows the metric
of the Universe, after all the measuring instrument uses particles
from beyond Earth for its means of measurement ! For this reason it is
able to measure the equivalent on Earth which is termed "vibration"
because each "period" is not repeatable i.e. lack of accountability
of all forces viz a vi displacement current which represents the weak
force.
Best regards

best re-read it again, and again... Gauss' law is in 3d, it has to be in 3d
because the electric field from a charge is not confined to a plane... never
was and never will be. unlike your thinking art.

>Vibration is resonance in terms of our Earth since it does not account
>for all forces involved in the Universe which requires balance or

the 'universe' makes no requirements, it is the laws of physics that control
the universe. nothing in the universe is anywhere near in equilibrium or we
would all be cold dark cinders.

> doesn't explain the asymmetric 'snapshot' here.

My grandsons must have interrupted and distracted me on
that earlier posting. I should have said there is no
extra reactance associated with different signs on
the voltage and current than there is when they have
the same sign. Any reactance on the left side has its
mirror image on the right side.

> At the left side we see '+' voltage and '+' current and
> at the right side we see '-' voltage and '+' current ! Why should it be
> asymmetric?

It is asymmetric because the voltage envelope and current
envelope are spatially displaced by 90 degrees. If you
plot the voltage and current envelopes for 3 wavelengths
you will get the following - pardon the ASCII. One is the
sinusoidal voltage envelope and the other is the sinusoidal
current envelope.

```
/ \ / \ / \ /
/ \ / \ / \ /
-----------------------------------------------------
\ / \ / \ /
\ / \ / \ /

/ \ / \ / \ /
/ \ / \ / \ /
-----------------------------------------------------
/ \ / \ / \ /
\ / \ / \ /
```

Sometimes voltage and current have the same signs and sometimes
they have opposite signs. Remember, this is a snapshot in
time. 1/2 cycle later the envelopes will be upside down.

Only because we , humans,do not know the extent of the boundaries of
the Cosmos as a whole
You cannot deal with true equilibrium while neglecting the outer space
beyond our Universe. Study the law of partial pressures to get a
deeper understanding.
We can only deal in the Universe we know which is only one bubble or
boundary of many that constitutes the Cosmos. But let it drop David.
Yes, I have an antenna that I lifted into the rotator on my tower with
my bare hands for top band and other bands including AM! I built it
and many others on the theories and principles that I have enunciated.
Maybe my theory is incorrect and the antenna, which is a fact,sorry
about that, can be attributed to a different theory. I will continue
to look for a alternative that also is agreed upon by present antenna
computer programs which I assume to be correct as they are based on
the presence of equilibrium] with accountability for all forces,
because they duplicate the results and configuration of my rotatable
antenna. In the mean time study the thread regarding helix antennas on
QRZ antenna construction which now has over 4k hits without similar
comments such as yours.

Roy, I am not questioning the accuracy of your
measurements - I'm sure they are extremely
accurate.

What I am questioning are your concepts and
conclusions about those measurements.

As illustrated in Kraus' antenna book, the end-
to-end current phase changes by about 3 degrees
for a 1/2WL dipole or a 1/4WL monopole. My question
for you is:

How can a current that changes phase by 3 degrees
in 90 degrees of antenna possibly be used to
determine the delay through the antenna wire?
- or through a loading coil?

Hint: The current in a standing wave antenna is of
the form:

I(x,t) = C1*cos(bx)*cos(wt) + C2*cos(wt+bx)

where C1 >> C2

i.e. the phase changes primarily with t but primarily
not with x. For any time t, the measured phase up and
down the antenna changes very little.

I suppose that Gauss has a law that is basic to Maxwells laws but
certainly not his law of statics. That particular law is two dimension
which does not include time.
Another scientist supplied to him a similar law that was also two
dimensional and it was that law provided the clue which required
clarification such that the two dimensional findings had to be added
to to match the metrics of equilibrium as required by Newton. If
Newton had not required uniformity of metrics it is quite possible his
laws would not have been corrected until the discovery by Foucault
which Maxwell had deduced or predicted as being present before
Foucault was born.
That force was determined as being the weak force by me which is
required for the grand unification theory (GUT) which unites all the

sciences of nature which includes the electricity matter which you
have boxed as being isolated from classical physics as we know it.
Frankly David, you have over estimated your value as a engineer by
your neglect of physics

Exactly, the more you post, the more obvious agreements
we have. The following current is the one that dominates
a standing-wave antenna.

I(x,t) = Imax*cos(kx)*cos(wt)

Such a current cannot be used to calculate delay from
phase shift in a wire or in a coil. Yet, that is exactly
what w7el and w8ji did.

Are you leaving the thread because you are on the verge
of proving w7el wrong?

2287. Hardware suggestions for mounting several antennas?

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-19 03:59:31 UTC
From: Heath Roberts <htroberts@gmail.com>
Message-ID: <53288989-f2d3-40fb-983e-cc18573ddf00@y7g2000yqa.googlegroups.com>
Source record: 16310

I'd like to mount several antennas at more-or-less the same spot:

- wideband receiver (thinking of a Diamond D130NJ)
- broadcast FM receiver
- directional TV receiver (Channelmaster 4228)
- aviation band
- 450MHz commercial band
- 2m/70cm transmit/receive (Diamond X50NA)
- WiFi
- satellite radio receiver

I know putting them close to one another isn't ideal and may cause interference, but I'd like to start there and see whether it's a problem. None of the transmitters will be high power.

I plan to put them on the gable end of a wall, with mast(s) that go above the roofline. The mast(s) need to end up about 18" away from the wall to clear the roof overhang, and I'd like to make as few wall penetrations as possible.

My ideas include:

- mounting a couple of pieces of uni-strut horizontally and using regular stand-off mast brackets
- using a short piece of tower, attached to the wall, and some sort of brackets to hold antennas off of that.

Any other suggestions that are maybe obvious to people with more experience installing base station-type antennas?

Thanks,
Heath

An r-f ground does not exist at the top of your tower,
or any tower.

Unless some means is provided to prevent r-f current flow
on the outside of the coax and on the tower structure,
they will radiate/receive r-f energy.

This probably accounts for most of the pattern effects
that you didn't expect to have (regardless of the real
pattern that your cone and helix generates).

Thus making the vertical antenna longer than 5/8WL.
Using the top of the tower for a ground simply
makes the tower part of the antenna system turning
the entire array into an off-center-fed vertical
dipole with the bottom end grounded. For instance,
a 1/4WL 20m monopole mounted on top of a 60 foot
tower using the tower as the coax shield ground
has a take-off-angle of 57 degrees. The highest
RF current is near the middle of the tower. :-(

To make matters even worse: I had a similar problem
with drooping 1/4WL radials DC insulated from the tower.
The drooping radials coupled RF into the tower and
turned it into a radiator which screwed, oops, I
mean skewed the radiation pattern upwards. It took
me a long time to figure out why my horizontal dipole
was magnitudes better than my 1/4WL vertical on top of
the 1.25WL tall tower which was grounded at the bottom
and floating at the top.

> will only detect alternating current.

Looking at only one current sample point, one cannot tell
the difference between standing waves and traveling waves.
However, there is a large difference between standing waves
and traveling waves.

If you measure the same current phase at two sample points
that are physically 30 degrees apart, you are dealing with
standing waves.

The equation for a standing wave is of the form:

I = Imax*cos(bz)*cos(wt)

This current is the primary effect on a standing wave
antenna and cannot be used to measure the delay between
points in an antenna because this current does not change
phase relative to length 'z'.

If you measure a 30 degree phase shift in the current
between two sample points that are 30 degrees apart,
you are dealing with traveling waves.

The equation for a traveling wave is of the form:

I = Imax*cos(wt-bz)

This current is a secondary effect on a standing wave
antenna. This is the current that changes phase with
physical length 'z' but is swamped out by the standing
wave.

Roy, you listed three possibilities for people who
read your postings.

1. Those who agree with you and are therefore right.

2. Those who disagree with you and later change their
minds to being right.

3. Those who forever disagree with you and are therefore
forever wrong.

Please consider the 4th possibility.

4. Roy Lewallen is not omniscient and could possibly
be wrong.

Again, would someone please forward this to Roy since
he has plonked me?

Thank you all for those points raised. I added the ground to the dish
because I was getting a lot of static one night, I have not had any
since but
I need time to compare. The grounding line is a heavy silver coated
braid connected
to each section and to ground. My coax drops to ground and then goes
underground
for a 100 feet or so and grounded again when it resurfaces.
Regards
Art

Some designs use drooping radials to reduce the vertical angle of the peak radiation launched by the monopole section.

But that is a conclusion made for an infinite distance, with consideration of the propagation environment on the intrinsic pattern launched by the monopole, and the height of the monopole + its elevated radials above the earth.

The link below leads to paste-up of NEC screens showing the performance of a monopole driven against four 1/4-wave, essentially horizontal radials. The entire system is isolated from earth ground.

The driving impedance, the elevation pattern shape, and the peak gain are close to "textbook" values for a 1/4-wave monopole driven against a perfect ground plane.

A form of this design is being used with good success in the AM broadcast industry -- where using a conventional, buried-radial ground system is impractical due to rocky terrain.

The groundwave performance of these systems shows that their intrinsic gain is maximum in the horizontal plane, and very close to the theoretical value of 5.15 dBi.

Pretty much what I did was use a 48" piece of Flex-Angle as the horizontal piece. On one end of the flex I mounted an Arrow 2m/70cm J-pole antenna and on the opposite end of the flex I mounted the Arrow 6M ground plane. I then mounted the flex-angle perpendicular to the mast with 2 U-bolts. Several diffent antennas could be mounted on the mast at different levels. I used the MFJ antenna analyzer on each antenna and they check great and also work great. I used the Arrow antennas because if there is such a thing as a bullet proof antenna Arrow builds them. Jesus said that not all that claim Him are His:

Matthew 7:15-23, "Beware of false prophets, which come to you in sheep's clothing, but inwardly they are ravening wolves. Ye shall know them by their fruits. Do men gather grapes of thorns, or figs of thistles? Even so every good tree bringeth forth good fruit; but a corrupt tree bringeth forth evil fruit. A good tree cannot bring forth evil fruit, neither can a corrupt tree bring forth good fruit. Every tree that bringeth not forth good fruit is hewn down, and cast into the fire. Wherefore by their fruits ye shall know them. Not every one that saith unto me, Lord, Lord, shall enter into the kingdom of heaven; but he that doeth the will of my Father which is in heaven. Many will say to me in that day, Lord, Lord, have we not prophesied in thy name? and in thy name have cast out devils? and in thy name done many wonderful works? And then will I profess unto them, I never knew you: depart from me, ye that work iniquity."

Thus, according to Jesus Himself, Hitler could not have been a Christian.
As for those Christians that have a "holier-than-thou" attitude, maybe you dont know very many Christians.
If this is an antenna forum, Im sure you will not care to respond to this.

God bless you Tom.

But that doesnt prove the human eye evolved from one a bacteria had. Even
that sensory cell that the bacteria had would cease to function if the
components of that cell were not all present and functioning.

Read "Hitlers Cross" by Lutzer to understand that Hitler was a manipulator, especially of the Church. Also read the following:

Matthew 7:15-23, "Beware of false prophets, which come to you in sheep's clothing, but inwardly they are ravening wolves. Ye shall know them by their fruits. Do men gather grapes of thorns, or figs of thistles? Even so every good tree bringeth forth good fruit; but a corrupt tree bringeth forth evil fruit. A good tree cannot bring forth evil fruit, neither can a corrupt tree bring forth good fruit. Every tree that bringeth not forth good fruit is hewn down, and cast into the fire. Wherefore by their fruits ye shall know them. Not every one that saith unto me, Lord, Lord, shall enter into the kingdom of heaven; but he that doeth the will of my Father which is in heaven. Many will say to me in that day, Lord, Lord, have we not prophesied in thy name? and in thy name have cast out devils? and in thy name done many wonderful works? And then will I profess unto them, I never knew you: depart from me, ye that work iniquity."

> I guess he didn't care for the Sermon on the Mount!

That quote is from the same One who gave the Sermon on the Mount. Hitler was NOT a Christian.

> And the roots of Manifest destiny can be traced John Winthrop's "City upon
> a Hill" sermon in 1630.
>

Toss a coin:
<http://www.answering-christianity.com/bible_adultery.htm>
(Note that the above web page is from the Islamic point of view).
Various parts of the bible offer different answers. The church still
hasn't officially recognized divorce, making half the US also
adulterous.

<http://en.wikipedia.org/wiki/Adultery>

<http://www.newworldencyclopedia.org/entry/Adultery>
"In Judaism, adultery was forbidden in the seventh commandment of the
Ten Commandments, but this did not apply to a married man having
relations with an unmarried woman. Only a married woman engaging in
sexual intercourse with another man counted as adultery, in which case
both the woman and the man were considered guilty."

>Bible written?

There's quite a bit on the topic here:
<http://www.bible-researcher.com/kingjames.html>
Basically, it was called "Elizabethan English". The 54 authors of the
1611 Authorized Version (there were several subsequent mutations and
revisions) did an excellent job of translation, organization, and
keeping the Anglicans, Puritans, and other cults from dominating the
final product.

In college, I read Chaucer in the original "English". It was painful
and only vaguely resembled English in any recognizable form.

Newton's Principia was published about 75 years after the King James
Bible, in 1686. All of Newton's scientific papers were in Latin. For
example, Principia:
<http://books.google.com/books?id=WqaGuP1HqE0C&printsec=frontcover&dq=Isaac+Newton%27s+Philosophiae+naturalis+principia+mathematica#PPR1,M1>
However, his correspondence was in fairly readable English, and not at
all like Olde English. There are several fragments at:
<http://en.wikipedia.org/wiki/Writing_of_Principia_Mathematica>
which show really weird punctuation and sentence structure. I guess
extra long comma spliced sentences were fashionable at the time. It's
difficult reading, but if one chops up the sentences into smaller
pieces and translated the idioms, it looks almost like modern English.

Actually, electrons in a wire are slow-moving particles
and tend to oscillate back and forth at RF frequencies
rather than "flowing".

But what is being discussed here is the total current
reported by EZNEC. Is EZNEC wrong when it indicates
1 degree of current phase shift in 30 degrees of
length in a dipole antenna?

A phased array with 4 elements compared to one with 2 elements, can
potentially have more gain, and better control of side and
backlobes. It's just because you have more things to adjust to control
the pattern, so you can get "closer" to whatever pattern you want.

A two element array with variable phasing has the nice property that
it's possible to put a "pattern null" on an interfering source (in
fact, you can put N-1 nulls where N is the number of elements), and
for low bands, that can be real useful. Forward gain (on receive)
isn't all that big a deal on low bands because of the usually large
atmospheric noise.

A classic 4 square doesn't have the flexibility of nulling noise,
because it has only 4 (or 8) "beam positions" and you'd have to hope
that one of the patterns produced happens to reduce the interference
you're trying to suppress.

None of the inexpensive simple phased arrays has a very narrow beam
(compared to something like a 3 element Yagi for 20m), so the real
advantage is in having something that can be adjusted at all, compared
to a fixed dipole.

W1GHZ has a website on amateur microwave stuff that might be useful (construction practices, etc.)

If you have access to a university library or online equivalent, there was a set of articles in the IEEE Antennas and Propagation Magazine (not the transactions on A&P) a few years back covering design of various reflector antennas.

The Cassegrain is popular for the reasons you give: low noise from behind the antenna, especially if the secondary reflector is underilluminated. And, it lets you put the electronics right at the feed without having to worry about putting them out at the prime focus.

You might also look at the Gregorian or Dragonian configurations, which are offset feed schemes. The Allen Telescope Array is using a form of Gregorian.

After that, it's mostly a matter of paper and pencil and working out the curvatures. The biggest challenge is in figuring out what the effect of your construction tolerances is.

What 30 degrees? There aren't any "30 degrees of length"
in a loading coil, and there doesn't have to be.
Cecil, repeating your fantasies over and over again don't
make them true.

That 'sometimes' opposite is extremely important in my eyes. When you explained
in phase and '+' and '-' at the same time, i figured; + x - = nearly zero=free energy !
So i went searching for antenneas etc. and found even the patent ! Even films
were found on the subject. I didn't say it was indexed but via via. Think out of
the box. [if you can]

The current measuring device has to measure the complex current
(relative to the voltage). Active power going into the antenna and
being radiated or turned into heat is the product of the voltage and in
phase current. Reactive power which flows back and forth between
antenna and rest of system is the quadrature phase current.

> What relationship would there be between maximum current at the feed
> point and affective radiated power.

None, really, unless the system is perfectly matched. Consider a case
where you have a big capacitor as the antenna, and a big inductor on the
other side of the current meter. You could have very high currents
flowing in the LC resonant circuit, but very little actually radiated.

I've been told in both my license
> preparation classes that making sure that the transmitter sees a low SWR
> does not insure a good signal out of the antenna.

This is true, but usually refers to the idea that a lossy
antenna/feedline can improve the SWR seen by the transmitter.

I'm looking for some
> way to actually measure the amount of energy that is getting to the
> antenna since it seams impractical to measure the signal strength in the
> near or far fields during operation of the transmitter.

No more impractical to measure field strength then accurately measure
the energy going to the antenna. Both can (and have) been done.

Field measurements only measure at some point(s) in the field, so if you
have any directivity, then what you measure in direction A may not
relate well to what's being radiated in direction B.

OTOH, measuring the power flow in the feedline doesn't tell you whether
the power is radiated, or just heating the antenna.
>

2315. Smithe Antennas of Laurel MD ?

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-20 17:40:41 UTC
From: Steve Stone <spfleck@citlink.net>
Message-ID: <gsic34jbs1@news.motzarella.org>

A friend gave me an unknown (to me) HF antenna.
Only marking on the 5 foot long white plastic pipe case is "Smithe
Antennas, Laurel, MD"
Inside the pipe are about 6 pieces of aluminum tubing , some 1/2 inch
white plastic pipe, one elbow, a plastic pipe T
with a small length of coax attached to a pair of "clips", and a set of
coils stuck in Styrofoam.

No paperwork.
Anyone familiar with this one?

Steve
N2UBP

>
> An ad hominem attack.

No, it isn't ad hominum. Put another way, there is a lot of evidence
that points to the theory of evolution as fact. Things change. The

related disciplines that verify the concept are likewise wrong if Evo is. All it will take to prove evolution wrong is if say modern humans are found in very early sediments along with the critters we've found there to date. But the evidence shows a forward movement of time, and never backwards. Modern animals only appear in recent times. Ancient ones show a terrmination. Those anomalies such as animals that haven't changed much, or "rediscovered" animals once thought extinct are just wonderous additions to life.

>>

>
> Ok, what other mechanisms do you think there are? Aliens??

Ohh careful there. Creationists who use the weak form of Intelligent design claim the possibility of aliens creating life here.

But the entire argument in that regard is specious anyhow. Evolution has not one single thing to say about the ultimate beginning of life. It only deals with what happens afterward.

>> But seriously the religious argument can be summed up in a
>> satisfactory manner by saying "I do not believe in evolution, I have

>> okay. I respect your faith.
>
> But you pretend that it is a blind faith, and that is also
> intellectually dishonest. There are many reasons for that faith, and
> intelligent design is a very good one.

Okay, you have no blind faith? Do a lot of investigating of the physics and chemistry and paleontology. Come up with experiments and refute it.

Intelligent design has performed no science, no peer reviewed research, with the exception of one report that was immediately refuted.

Instead, the Intelligent design folks want to debate. Strangely enough, that debate is envisioned as proving something. If evolution loses the debate, is there no evolution. If it wins, is their no God?

Here's a good idea. Instead of taking peoples money and trying to get ID insertd into schools curriculum, take that money and do good research!

Most distressing howevwer is the duality of the IDer's approach. the switching between the weak ID that is brought out when trying to sneak their belief into school science programs, (teach the controversy) and

the very same people saying that they want to replace the system as taught now with science that is in alignment with the Christian faith.

I don't think God needs or wants anyone lying for him.

>>
>> But insisting on s literal translation of the two different accounts

Don't know what to say here, Brian. Some times it's literal, some times it's not, and sometimes we just pick and choose.

>> is just as wrong as the flat earth of four corners,
>
> Ancient civilization knew the earth was spherical. The Egyptians
> understood this.

The spherical earth concept started around 330 B.C. It was well known during the middle ages. Oddly enough the resurgent Flat Earth, promoter, Samuel Rowbotham, came up with his "Zoetitic Astronomy" system, in around the mid 1800's which depended on his particular interpretation of the Bible. Interestingly enough, in the 1800's he engaged in public debates with leading scientists. One doesn't prove the other, of course, but it's interesting to see that the more things change, the more they remain the same.

I really don't want to belabor the group with much more of this, we need to get back to discussions of Art's antenna designs.

All I would say is that I would suggest some personal research, and repeat that evolution doesn't have a thing to do with origin, so just perhaps, there are people out there who might want to manipulate others with a red herring of an issue.

I'm glad you asked, Tom. There was no mention of
a loading coil. I am talking about a simple 1/2WL
wire dipole with current probes at the x=1/3 and
y=2/3 points as illustrated. Why I am doing that
will become obvious.

------------------------fp-------x-------y--------

This is a center-fed 1/2WL dipole with current probes
installed at points 'x' and 'y'. The 1/2WL dipole is
known to be 180 degrees long. Half of a 1/2WL dipole
is 1/4WL, i.e. 90 degrees long. From the feedpoint
to point 'x' is 30 degrees. From point 'x' to point
'y' is 30 degrees. From point 'y' to the end of the
dipole is 30 degrees.

This 1/2WL dipole in EZNEC uses two wires of 90 segments
each, i.e. each segment equals one degree of dipole.
Point 'x' is at segment 30 and point 'y' is at segment
60 in Wire No. 2 on the right side of the dipole above.

Here are the results directly from EZNEC:

Source 1 Current = 1 A. at 0.0 deg.

Wire No. 2:
Segment Conn Magnitude (A.) Phase (Deg.)
30 'x' .87634 -1.49
60 'y' .52573 -2.43
90 Open .01185 -3.12

The phase of the current changes by 1.06 degrees between
point 'x' and point 'y' which is 30 degrees of antenna
WIRE (not loading coil). How can the phase of that current
possibly be used to determine the delay through the wire
which we know is related to the speed of light in the wire
medium? The delay through 30 degrees of wire at 4 MHz

would be about 20 nanoseconds.

In the 1/2WL wire dipole above, the phase of the current in each 90 degrees of wire changes by 3.12 degrees.

If Roy performs the measurements, he will correctly report a negligible phase shift in the current between point 'x' and point 'y' (just as he did for the loading coil).

Following his previous loading coil logic, he will report that the delay through 30 degrees of wire dipole is not 20 nS at 4 MHz as would be expected but is instead closer to zero, maybe one or two nanoseconds. We all know that report would be false. One cannot use a current with essentially unchanging phase to calculate delay through a wire (or through a loading coil).

If Roy cannot accurately measure the delay through 30 degrees of wire, why does anyone suppose Roy can accurately measure the delay through a loading coil using the phase of that same total current on a standing wave antenna?

Note that the true phase information is contained in the amplitude, not the phase, just as Gene Fuller said. If we take the ARCCOSine of the magnitudes above, we obtain:

Source, ARCCOS(1.0) = 0 degrees
Seg 30, ARCCOS(0.87634) = 29 degrees
Seg 60, ARCCOS(0.52573) = 58 degrees
Seg 90, ARCCOS(0.01185) = 89 degrees

Incidentally, I told all of this to Roy 5 years ago, Jan 2004, according to Google. He plonked me.

I should have said: "Sometimes voltage and current
envelopes have the same signs and sometimes they
have opposite signs." The voltage snapshot is at
t=0. The current snapshot is at t=90 degrees, i.e.
they do not occur at the same time.

Let's see if I can say it a different way.

When the current standing wave envelope is a cosine wave
at its maximum, the voltage standing-wave waveform is zero.

When the voltage standing wave envelope is a sine wave at
its maximum, the current standing-wave waveform is zero.

The graphs of voltage and current envelopes at which you
are looking do *NOT* occur at the same time. There is nothing
except confusion to be gained from assuming they occur at the
same time - since they *NEVER* occur at the same time.

For V*I to be meaningful in reality, they have to occur
at the same time. When the voltage envelope is at its
maximum, there is zero energy in the magnetic field.
When the current envelope is at its maximum, there is
zero energy in the electric field.

I don't blame him for plonking you. You're saying that because you fantasized that Roy would make a mistake that Roy would never make, that he also made the same mistake when measuring the delay through a coil. Cecil, a length of antenna is not a coil. A coil is not an antenna. Declaring that coils are antennas and vice versa doesn't make them so. You don't really know what the delay through your bugcatcher coil is. If you substituted a real transmission line for your coil, you could make the degree length - within limits - whatever you wanted it to be just by changing the Z0 of the transmission line.

So here's your logic: Because EZNEC reports a amall angular difference at the ends of your half-wave antenna in current, and because Roy

measured a small difference in delay through a coil, there must be a larger real delay across the coil due to the analogy with the half wave antenna. You're assuming, without proof, that the coil behaves as a piece of straight wire, therefore the coil behaves as a piece of straight wire. Nice logic. You have a lot in common with Art.

Well Tom I am not part of this debate but to say a coil is not a
radiator is silly It must radiate as does a helix antenna. The only
difference is how much slower the helix forces the charge to delay as
in "slow wave." Thus the coil act as a radiator where you must
multiply it by a velocity factor. After all, a "tesla" style coil will
display a resonance with the wire used much longer than a straight
wire length and like a helix will radiate.
Kraus states that for a helix one should not use wire shorter than two
wavelength
which I suspect is a substitute calculation for the VF change from a
straight radiator.

Sorry Tom, that is a diversion. The subject is NOT the delay through a coil. The present subject is the delay through a straight wire which is well understood. Please deal with the topic at hand. If you refuse, we will know that you are not sincere as far as technical facts are concerned.

Please ask Roy to prove that the current on a standing wave antenna can be used to measure the delay through a straight piece of wire that is x degrees long. If so, exactly how is it done?

Roy is NOT omniscient. He definitely made the mistake but like most gurus, refuses to admit it. You want to sweep the mistake under the rug through diversions but I won't allow you to do that. Once you and Roy admit that the current on a standing wave antenna cannot be used to calculate delay, everything else will become clear.

Please feel free to contact Roy by private email to resolve the issue. Roy has, so far, simply stuck his head in the sandbags and refused to respond. I'm sure he would have advised you to plonk me instead of engaging me, for fear of being proved wrong.

Yet, he admitted years ago that the phase of current in a standing wave antenna varies by a very small amount. He is presently trying to have his cake and eat it too. In the process, he (and you as a supporter) are hoodwinking the unwashed masses. Shame on all of you.

Because of adjacent coil coupling, it takes
more wire to achieve the phase shift effect
of a straight wire.

He does make quite a leap to the "family tree". Many such leaps seem to be accepted as fact. The primordial soup explanation has yet to be proven and the experiment cited as proof has already been debunked but it still finds it's way into textbooks as fact. The scientific method doesn't allow us to make assumptions then try to back them up in further investigations. It seems that our course of institutional investigations have lead to censorship through active measures against those who don't fully buy into it.

That isn't what I meant. I was speaking of those functions without which the organism is not viable. Your choice of a life form without the Blood Clotting Cascade is an example of a life form that perhaps was designed as food or at least highly expendable otherwise it would have been designed with self-repair and defensive mechanisms in mind. Even if you don't believe in ID, you indicate some knowledge of the kind of complex processes I allude to.

I didn't mention the Eye. How is it relevant? Bacteria is still life and still highly complex at the molecular level.

How is this a straw man? What "things had to happen first" for any life?
You justify my argument that it takes a leap of faith. Do you mean to say
that life cannot be created if we can't do it?

> > But the Atheist will say this is

Darwin was a devout Atheist and that was the basic a priori of his
investigations and theory. We know that life forms adapt to their
surroundings. It is obvious. We don't find them changing from one species
to another. We don't even find fossil evidence of "missing link" organisms
that prove the great transitions of DNA between species.

So you do believe in heaven? Or not? The shooters at Columbine where
wearing T-shirts that said "Natural Selection" and spent lots of time on
neo-Nazi web sites. It is a matter of evidence. We can't cross examine
them under oath (?) so they can't answer for their actions.

This was bull crap propaganda so that he would have less trouble with
Christians, Like Obama, who is obviously preaching Marxist Secular Humanism
in his speeches, and evidence suggests, sought out his home church as a
forum for his political advancement after he lost to Bobby Rush for "not
being black enough" as his constituents put it. I don't think it imparts a
benefit of the doubt if he is a Christian for fleeting moments when he finds
himself in a church.

Not only was Hitler a known liar, he actually invoked a half-baked pagan
religion to support his Aryan beliefs.

Manifest Destiny and Evolution come together as justifications of the westward movements, genocide of the indigent American population, as well as most of the genocides, mass murders and revolutions in the 19 and 20th centuries.

And Jeremiah Wright gave sermons too. Citing preachers tells more about you. Let's not go there because Jesus himself stated that "there will come false prophets". You need to work on your discernment.

> believe in evolution now as it does to believe in a flat earth.

"Flat earth" is nowhere in the Bible. What evidence supports that all life is an adaptation from a single organism? What evidence supports that DNA can change radically and be viable. Indeed prove that genetic mutation actually can result in anything but a loss in material, thus result in a De-evolution instead of evolution? Perhaps we are all adapted from ferns. There is significantly more genetic material in ferns than most in the animal kingdom. What can the new life form viably reproduce with. This would seem to be most possible with reproduction by cell division, but individual survivors would seem to be food at the point it emerged. Where are the new single celled species that have sprung up spontaneously from existing species?

> Creationists have unwittingly be one of the greatest forces in research

>
> But seriously the religious argument can be summed up in a satisfactory
> manner by saying "I do not believe in evolution, I have faith that God
> created everything in it's present form." And that is okay. I respect
> your faith.

That isn't my argument. Please don't assume that the above Blog "Either-Or" arguments are the only ones out there. Is it your argument that no matter how life came to be at all by any means could not have been spurred on by an unseen force? Or that every miracle can be explained by accident or natural progression of events? Perhaps the predictions that were fulfilled in the Bible were simply intelligent assessment by natural progression. Although you could point to those, it doesn't explain it all away.

Here is the philosophical problem. If the Universe follows a purely predictable mechanism, or a combination of predictability and seemingly random events, It does not prove or disprove a design. At this point, I can't pose a definitive theory of how the Earth, Solar System, Universe or Life came to be. The Bible is not a scientific journal, It is a historical journal penned by those who didn't consider a scientific approach to explaining any event. In many cases it is a narrative and in others it is a legal documentary record of events, observations and inspirations. It is a fascinating concept that it could have actually been orchestrated by the Divine. Perhaps we could agree that although the scientific explanation is lacking in scripture, we shouldn't dismiss the idea that there is no truth underlying the explanations that is yet to be revealed. Once upon a time, one could investigate while still believing in a creator. That seems to have lost ground to Political constraints. My thought is that Macro Evolution has become only one of many thoughts forced on a captive audience by condescending liberals that are bringing society to crisis.

Not my argument either. You make a great many assumptions of my arguments and dismiss them as "straw man".
"There will come false prophets". they will be known by their works.

Sorry, that's exactly what the scientific method allows
us to do.

1. Form an hypothesis
2. Compare it to reality
3. If it doesn't fit, fine tune the hypothesis
4. Then goto 1, Else it is true

The fact that we humans share 95% of a chimpanzee's
DNA is proof enough that evolution is valid and we
are literally a "Monkey's Uncle". The only question
left is: "Did God cause that evolution?"

OK, so what other primate shows at least 90% Ok so what other organism shares 95% of a human's or Chimpanzee's DNA. And now show that a chimpanzee did not evolve from a human. So maybe you're a monkey's daddy. Maybe they evolved from each other. Of maybe there are similarities that just worked out and perhaps one didn't come from the other at all. Lots of speculation here. Speak for yourself.

"Evolution
Further information: RNA world hypothesis

DNA contains the genetic information that allows all modern living things to function, grow and reproduce. However, it is unclear how long in the 4-billion-year history of life DNA has performed this function, as it has been proposed that the earliest forms of life may have used RNA as their genetic material.[84][96] RNA may have acted as the central part of early cell metabolism as it can both transmit genetic information and carry out catalysis as part of ribozymes.[97] This ancient RNA world where nucleic acid would have been used for both catalysis and genetics may have influenced the evolution of the current genetic code based on four nucleotide bases. This would occur since the number of unique bases in such an organism is a trade-off between a small number of bases increasing replication accuracy and a large number of bases increasing the catalytic efficiency of ribozymes.[98]

Unfortunately, there is no direct evidence of ancient genetic systems, as recovery of DNA from most fossils is impossible. This is because DNA will survive in the environment for less than one million years and slowly degrades into short fragments in solution.[99] Claims for older DNA have been made, most notably a report of the isolation of a viable bacterium from a salt crystal 250-million years old,[100] but these claims are controversial.[101][102]" --from Wiki DNA http://en.wikipedia.org/wiki/DNA

CORRECT! he got one right! must be dumb luck.

you are absolutely correct, there are no terms in maxwell's equations
representing lumped loads. HOWEVER, you can use maxwell's equations to
derive the fields that explain how lumped elements work.

No, it's not a diversion. You're making up things in your head.
The original controversy involved a claim by you that the coil in
a short, mobile antenna made up for the degrees lost in said
shortened antenna. You were wrong. Now you've changed the subject to
a half wave dipole, attributing to Roy a position he would never take.
That's an old, stupid trick a woman might use in a domestic argument,
but it won't work here. I know you have a pathological need to

win every argument (you ought to talk that over with your analyst) but
that's no reason anyone should waste time agreeing with you.

What's the relative size of "reflector" and helix? (i.e. is the
reflector in the near field of the helix, in which case, you could
easily have waves propagating along the surface of the reflector)

Very good but he rides a motor bike and I don't ride those vehicles of
death.
Cecil is correct tho, The lumped circuit represents the radiator
length times the velocity factor plus a fudge factor for being a
lumped load.

I live near Laurel (12 miles) and used to live in Laurel and I have no
recollection of this. A check of the local phone book reveals
no such entity,

There are a couple of references on the internet to a "Smithe Windom"
which K3MT says he devised. K3MT is now resident in Grear Falls, VA
which like Laurel, MD is in the greater Washington, DC metro area. You
might wish to contact him and do a google on him.

There is a lot of contractor electronics going on in Laurel, MD area
as nearby are located NASA Godard Space Flight Center, Johns
Hopkins Applied Physics Lab, a whole lot of industry connected to the
very nearby National Security Agency, a big ex-Westinghouse radar
manufacturer (don't recall who owns it now, but radar research has
been going on for decades at the facility and even the Patuxent
Research Center which is a big facility for tracking wildlife
migrations among many other things. They also raise whooping crane
chicks and other exotic wild and endangered birds and use electronic
tracking techniques.

So whether this is a big time outfit, or something made in someones
garage, there is plenty of potential for something like that antenna
to be made in this area.

The helix is four foot long and a foot diameter. The base of the
reflector is 1.5 feet
with a 45 degree angle. I have had the helix 0.5 feet shorter and 0.5
feet longer with similar results.On re examination of the antenn I now
see that the ground lead of the radiator is connected to the inside of
the reflector at a half way point and the coax
ground is connected at the base of the reflector. I think I will
change that ground connection to a common point.

You left out mathmatical probabilities, as well as the failures of
chemistry, palentology, and archeology.

>
> Intelligent design has performed no science, no peer reviewed research,
> with the exception of one report that was immediately refuted.

Actually peer-reviewed science by ID scientists is coming out more and more.
Google it.

"The article is titled "The Origin of Biological Information and the Higher
Taxonomic Categories." The conclusion of the article, in brief, is that
design explains things that natural selection cannot. Proceedings is a
peer-reviewed publication. According to the then-editor, the three reviewers
were all faculty members of respected universities and research
institutions. The editor also stated that, while the reviewers did not agree
with the conclusions, they found nothing scientifically invalid in the
reasoning."

http://www.allaboutscience.org/intelligent-design-peer-reviewed-faq.htm

>
> Instead, the Intelligent design folks want to debate. Strangely enough,
> that debate is envisioned as proving something. If evolution loses the
> debate, is there no evolution. If it wins, is their no God?

For the former, no. For the latter, yes, because the premise of evolution is
that God is not necessary for the diversity of life on this planet.

>
> Here's a good idea. Instead of taking peoples money and trying to get ID

Well, the research is out there. It seems to me that the darwinists dont
want to even allow their science to be scrutinized.

I dont know of anyone that wants to replace it with Christian "science". On
the contrary, ID scientists welcome the side by side comparison of the
facts, and let the student do his own critical thinking and see which theory
is more plausable.

>
> I don't think God needs or wants anyone lying for him.

No, but He put us here to put things into the light so they can be
scrutinized, not to descriminate as to what people can and cannot study.

No, sometimes you have to read it for what it is, and quit reading things
into it, such as "two different accounts". Anyone that is truly
intellectually honest can see that it is the same account.

Evolution does speak to origin, in the sense that it contradicts the
Biblical account. Even evolutionists will espouse a theory of origin, what
ever they might believe. Again, the main hinge of evolution is the
transitionary forms of life, which are glaringly missing. Examine both
theories of origin, and see which theory fits the facts better. It wouldnt
be evolution. And if evolution is so air tight, I dont think they would
have a problem at all with allowing ID into the arena, especially since
evolution is so reproducable in the lab. Oh wait, it isnt! Hummm. I guess
its a theory still. Along with ID.

> No, it's not a diversion. You're making up things in your head.
> The original controversy involved a claim by you that the coil in
> a short, mobile antenna made up for the degrees lost in said
> shortened antenna.

Sorry Tom, that is a false statement. Please stop misquoting
me. The coil occupies some number of degrees but not nearly
enough to make up for all of the "lost" degrees which are not
lost at all as I have demonstrated in the past and will do so
again here. Following is a *resonant open-circuit 1/4WL stub*
that is electrically 90 degrees long yet it is only physically
38 degrees long.

Z1
---19 deg 450 ohm feedline---+---19 deg 50 ohm feedline---open
-j145

The 450 ohm feedline occupies 19 degrees of the stub. The 50
ohm feedline occupies 19 degrees of the stub. The stub is
physically 38 degrees long total. It needs another 52 degrees
to make it electrically 1/4WL long and resonant. The "lost"
52 degrees is *not lost at all* and occurs abruptly at the
junction point '+'. Call the impedance at that point Z1. The
52 degrees of phase shift occurs between Z1/450 and Z1/50.
Microsmith says that Z1 = -j145.

Z1/450 = -j145/450 = -j0.3222

Z1/50 = -j145/50 = -j2.9

Take a look at the number of degrees between -j0.3222 and
-j2.9 on a Smith Chart. Surprise! There is the "lost" 52
degrees. Those degrees are not lost at all and are just
a fact of physics concerning phase shifts at an impedance
discontinuity.

Now if we multiply the stub impedances by 10, we have
a reasonable facsimile of a resonant base-loaded monopole.

19 deg coil
////////////////-----19 deg ~500 ohm stinger-----open

Z0= ~4500 ohms
VF= ~0.02

The loading coil occupies 19 degrees and the stinger occupies 19 degrees. There is a 52 degree phase shift at the coil to stinger junction. There are no "lost" degrees. 19+52+19 = 90 degrees.

There were (are) two sides to the argument.

1. The coil furnishes the "lost" degrees.
FALSE!
The coil furnishes some number of degrees but not nearly enough to make up for the phase shift at the coil/stinger junction.

2. The coil supplies almost zero degrees.
FALSE!
The phase shift at the coil/stinger junction is not enough to account for the "lost" degrees. The magnitude of that phase shift is easily calculated on a Smith Chart.

Please skip the ad hominem attacks and use the laws of physics and mathematics to prove me wrong.

Tom Donaly wrote:
> You were wrong. Now you've changed the subject to
> a half wave dipole, attributing to Roy a position he would never take.

On the contrary, Roy described his procedure in detail. I
then applied Roy's exact procedure to a 1/2WL dipole to see
if the procedure is valid for finding the delay through a
straight wire. Just as I suspected, the change in the phase
of the current is mostly unrelated to the number of degrees
in the antenna wire. Therefore, Roy's procedure is invalid and
cannot be used to measure the delay through a loading coil.

He made very accurate, very meaningless measurements - as did
w8ji. The primary current on a monopole, loaded or not, is of
the form I = Imax*cos(kx)*cos(wt). The amplitude is solely
a function of kx. The phase is solely a function of wt.
At any instant of time, the phase is the same all up and down
the wire including through the loading coil. Roy once verified
that is what EZNEC reports.

So the question remains: How did Roy use the current on a
standing-wave antenna, which doesn't change phase relative to
any other point on the entire antenna, to calculate the delay
through a loading coil or through a wire? The phase at the
bottom of the coil and the phase at the top of the coil are
always the same no matter what the delay through the coil.
Those phases are the same as the feedpoint phase and the phase
close to the tip top of the antenna within a very few degrees.

I don't have to prove you wrong, Cecil, you have to prove yourself
right since you came up with this novel way of explaining antenna
behavior. A false analogy won't prove you right, in any case. Anyway,
this has all been chewed over before, and you've already used your hick
style argumentative techniques to little avail. It's too bad some
amateurs take you seriously enough to believe this garbage. They'd do
a lot better, and know a lot more if they'd learn the techniques and
mathematics found in innumerable books on the subject.

I have offered a proof with which I detect no technical
problems and nobody has offered any valid technical argument
against what I have presented. My argument is not novel
and is based on sound physics as presented by the technical
references I have provided.

What I find difficult to understand is the sandbagging
going on in defense of an old wives' tale.

Your description of the phenomenon is exactly that. Your claims about standing wave current are unadulterated bull crap. Your understanding of wave phenomena is significantly flawed in certain respects. You refuse to recognize where you have erred, and you fend off criticism by making ludicrous accusations of other people. With all due respect your behavior is absolutely pathological, which unfortunately, tend to negate the value in any valid arguments you might otherwise make.

Although some people do occasionally attempt to correct you where you have made a mistake (others have given up trying), they are not 'out to get you'. Try to keep it all real and in perspective, OM.

You are certainly free to produce the physics and
mathematics to prove your assertion. Where is it?

I have provided equations and references. Please
tell me exactly which ones you dispute so I can
quote them.

> Although some people do occasionally attempt to correct you where you
> have made a mistake ...

The only mistakes of which I have been accused
are poor choices of words to which I plead guilty.
Nobody has accused me of invalid equations.

What you are experiencing is the dumbing down of
technical people where the lumped circuit model
and "mashed potatoes" model of energy in a transmission
line has taken over.

The equation for standing waves has been quoted
from "Optics", by Hecht; "... Optics", by Born and
Wolf, "Fields and Waves ...", by Ramo and Whinnery,
"Antennas ...", by Kraus, and "Antenna Theory", by
Balanis.

I strongly suspect you are capable of understanding
those references.

The following two equations are equivalent and are
the equations for pure standing wave current as
exists as the primary current on standing wave
antennas.

I(x,t) = 2(V+/Z0)cos(kx)*cos(wt)

I(x,t) = (V+/Z0)[e^(jwt-kx) - e^(jwt-kx)]

If you cannot look at those equations and see that
the phase is unchanging relative to all points on
the wire, you need to go back to school and
hone your math skills.

As a newcomer to the group I'm hesitant to join a discussion which has been running for almost 200 postings, and where the protagonists understand the topic in much greater depth than I do. But here goes ....

My starting assumption is that EZNEC can model a helical inductor reasonably accurately, with the exception of the increase in AC resitance caused by proximity effects.

If I take an EZNEC model of a coil - 40 turns #14 wire, 6" diameter, 12" long - I discover it has a characteristic impedance of about 2550 ohms at a self-resonant frequency of around 6.1 MHz. If I use it as the base loading coil for a short vertical antenna with a 6ft whip above it, I notice that EZNEC shows a difference in the current at the top of the coil compared with the bottom of about 0.69:1, and a resonant frequency of 3.79MHz.

I then look to see which of the various models might reasonably predict the values observed in the EZNEC modelling.

Clearly, a simple lumped-element inductor doesn't get close. I've read various web pages and postings which argue qualitatively that things like "distributed capacitance" might explain some of the observations, but as yet I've seen no quantitative analysis which attempts to predict the numbers.

In contrast, I look at the work of Corum & Corum and of G3YNH who insist that "coils are best regarded as transmission lines", and I get quantitative results which closely match the EZNEC results. For my example coil, I get a self resonant frequency of 6.3MHz (cf 6.1MHz), a characteristic impedance of 2792 ohms (cf 2550 ohms) and an Iout/Iin ratio of 0.72 (cf 0.69)

Not only that, the transmission line model predicts an inductive reactance very close to that needed for antenna resonance at 3.79 MHz

I'm a simple soul, and I don't pretend to understand all the maths involved; I merely observe that the transmission line approach delivers "hard numbers" that closely match those predicted by EZNEC. I've yet to see another model get close. So, until I do, I guess I have to favour the approach of Corum & Corum, G3YNH et al.

If someone can show me similarly accurate results from an approach based on a lumped-element model, I'd be interested to see them.

Steve G3TXQ

somewhere in between the two rails.

> Or, maybe
> 3. A less than quarter wave antenna is less than 90 degrees long.

Obviously true for the physical length. Just as obviously
impossible for the electrical length. If you understand
that the feedpoint is purely resistive and
Zfp = (Vfor-Vref)/(Ifor+Iref) then you will understand
that the antenna *must* be electrically an interger
multiple of 90 degrees long.

If you need help with that concept, let me know. If you
are embarrassed to discuss it in public, send me an email.

Yes, that's correct. Fortunately, proximity effect is generally
negligible unless the turn spacing is very close.

A single conductor doesn't have a characteristic impedance -- it's the
impedance between the two conductors of a transmission line. You can
measure a characteristic impedance between, say, a coil and ground, but
its value depends on the spacing between the two. If the coil is tilted
with respect to the ground, the impedance of this two-conductor system
will change with the position along the coil.

> predict the numbers.

It's difficult or impossible to do with lumped elements. A vertical
loading coil has not only series inductance, but also capacitance to
ground or, in the case of a dipole, to the other half of the dipole.
This capacitance varies along the coil, being greatest at the bottom and
increasing toward the top. (This is the cause of the varying Z0 I
mentioned above.) But there's also a delay associated with the
capacitance which complicates the interaction to the point where you

can't easily model it with lumped elements. And the coil radiates, which alters its current distribution.

That said, a lumped inductor makes a fairly decent model for a physically very small (in terms of wavelength) toroidal loading coil, since it has minimal capacitance to ground and a minimal amount of radiation. I actually built a vertical, loaded it with one, and made careful measurements which I posted on this newsgroup several years ago. Cecil is still complaining about it.

The displacement current flowing through those capacitances, not some "effective degrees of antenna" phenomenon, is what causes the current along a solenoidal loading coil to vary. If you reduce the capacitances to a low value as I did in my measurement, the currents at the ends become nearly the same, which is what the measurement showed.

>
> Not only that, the transmission line model predicts an inductive
> reactance very close to that needed for antenna resonance at 3.79 MHz

You've kind of lost me here, since I can't see how you've replaced a two-terminal coil with a four-terminal transmission line. And a transmission line doesn't radiate, so that sometimes-important property of a solenoidal coil is ignored.

> I'm a simple soul, and I don't pretend to understand all the maths

> delivers "hard numbers" that closely match those predicted by EZNEC.
> I've yet to see another model get close. So, until I do, I guess I
> have to favour the approach of Corum & Corum, G3YNH et al.

Be sure to test the approach with other configurations, such as longer and shorter coils, frequencies well away from resonance, etc. to find the limits of applicability of the approach. Does it correctly predict the field strength? Efficiency? Bandwidth?

> If someone can show me similarly accurate results from an approach
> based on a lumped-element model, I'd be interested to see them.

Me, too. The thing which prompted me to add the automated helix generation feature to EZNEC was the realization that lumped loads so often did a poor job of simulating solenoidal loading inductors.

Roy Lewallen wrote:
> A single conductor doesn't have a characteristic impedance --

On the contrary, that is a false statement. In my
"Electronic Equations Handbook", it gives the
characteristic impedance for a single horizontal
wire about ground. Obviously, ground is the missing
conductor. I believe that equation is also given in
ARRL publications. A horizontal #14 wire 30 feet
above ground has a characteristic impedance very
close to 600 ohms. Since all of our antennas are
located a finite distance from ground, your assertion
seems ridiculous.

> I actually built a vertical, loaded it with one, and made
> careful measurements which I posted on this newsgroup several years ago.
> Cecil is still complaining about it.

Yes, because the current on a standing wave antenna
doesn't change phase through the coil no matter what
the delay through the coil. EZNEC agrees with me.
Here is what EZNEC says about the current through
90 degrees of antenna:

EZNEC+ ver. 4.0
thin-wire 1/4WL vertical 4/21/2009 5:50:11 PM
--------------- CURRENT DATA ---------------
Frequency = 7.29 MHz
Wire No. 1:
Segment Conn Magnitude (A.) Phase (Deg.)
1 Ground 1 0.00
2 .97651 -0.42
3 .93005 -0.83
4 .86159 -1.19
5 .77258 -1.50
6 .66485 -1.78
7 .54059 -2.04
8 .40213 -2.28
9 .25161 -2.50
10 Open .08883 -2.71

How do you explain the fact that the current changes by
less than 3 degrees in 90 degrees of antenna? How can you
possibly measure the delay through a coil, or through a
wire, using a current like that?

> The displacement current flowing through those capacitances, not some
> "effective degrees of antenna" phenomenon, is what causes the current
> along a solenoidal loading coil to vary.

Rhetorical question: Did you know that "displacement current"
is a patch added to the lumped circuit model to try to make
get closer to reality?

> You've kind of lost me here, since I can't see how you've replaced a
> two-terminal coil with a four-terminal transmission line. And a

You wouldn't be lost if you knew that a single horizontal
wire above ground is a transmission line.

Too bad you don't accept the EZNEC results of that addition
which I have posted on my web page and you have ignored.

P.S. Roy has threatened to refund my purchase price for EZNEC
and declare my copy of EZNEC to be a pirated copy unless I stop
using it to prove him wrong.

Not to intrude, but I thought you were discussing a coil. The above
seems to be about an antenna.

By extension, if an inductor acts the same as an antenna, then a
capacitor also acts like an antenna. QEF.

So I guess that implies that a capacitor isn't much different than an
inductor.

I've misunderstood so much, I think I may just have to end it all.

That's actually pretty sorry for a CB whip. Most of 'em have at least 12 dB gain and are rated for 10,000 watts. A visit to your local truck stop will convince you.

It includes ground gain. However if they want to play this game, an
isotropic antenna has a gain of 6dBi, which gets you back to 3.9dBi, but
even that is pushing it for a 1/2 over a 1/4 , unless you can get it up
at a few hundred feet. :-)

Actually, if you want an emergency antenna for operating 20 to 6 meters with
a tuner, the A-99 Solarcon can do the job.

Let's face it, without favorable propagation, no antenna, regardless of its
alleged gain, is going to provide contacts. After that admission,
directionality and gain are about all that the beam antennas provide. For
someone living in a small footprint land parcel with very limited antenna
options, the A-99 by Solarcon is really a pretty good deal.

I've worked Europe, Africa, Russia and all of the US, Mexico, Central
America and South America with ease. When the bands are open, you are
capable of working most of the world with one of these antennas and only 100
watts. And I'm talking about voice contacts, not power miserly CW or digital
models.

Now, consider that you're sitting on your bed (your hamshack) and you are
thinking of the money that you have, which isn't enough to buy a tower, a

rotator and the beam that you want, but is enough to buy the Solarcon A-99 antenna, which you can put up yourself without protest from the landlord. On the one hand you have no operating at all, but in the other hand (A-99), you can work the world. Which would you choose?

Believe it or not, I was chewing the rag with a fellow in Austria one day for quite a while (can't remember his callsign). We finally got around to talking about station equipment and we went through the radio list and other stuff. I purposefully avoided mentioning my antenna (we were on 12 or 10 meters). But after a while, he wore me down and I admitted that I was using a Solarcon A-99. All he did was say, "That's a CB antenna!" gave his callsign and that was the last I heard from him. He was convinced that I was a bootlegger, even though I used my legal callsign which was then current in the callbook.

It's hard to believe that there are such snobs in the world.

2369. Electrical lenght vs. phisical lenght

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-22 07:40:28 UTC
From: "-.-. --.-" <a@a.com>
Message-ID: <gsmhll$6j7$1@nnrp-beta.newsland.it>
Source record: 16293

Hello,

not long time ago i was caught by a doubt, partially solved in my mind, but i think can be interesting for the folks here reply to a antenna newbie (me) about newbie questions :)

The doubt was (and is): a monopole, end feeded, that is 1/4 wave phisical lenght, is obviously also 1/4 wave electrical lenght, in respect of the classic "book image" that show the wave travelling (or standing, here i see different opinions...) cross the monopole just for 1/4 of the full sinewave. And this in my mind is OK.

Now, how i do treat a 5/4 wave phisical lenght monopole, in respect of electrical lenght ?? It is even a "1/4 wave configuration" and 1/4 wl electrical lenght, because the sinewave travelling (or standing) in the monopole terminate in both cases at 1/4 of the wave, or 5/4 is just 5/4 wl and 1/4 is 1/4 wl, electrically and phisically ??

Note: i'm wondering about the impedance, not about radation patterns. I'm aware that radiation patterns are singular in respect of the singular electrical lenght of the monopole. Or better, that is what i learn, right or wrong :)

The second question is about 1/4 wave vs 1/2 wave monopoles. I googled around, but no one define exactly why "1/2 wave antenna don't need ground plane". The most technical explanation i found is that due the high impedance at the feed point, the 1/2 wl antenna don't care about the ground plane. But i'm not so convicted about this, and a basic explanation of the 1/2 wl "no-ground-needed" theory is appreciated.

Apologize for grammar errors and lenght of the post. Regards and 73.

A physical 1/4 wave, behaves is an electrically 1/4 wave, with some
additional end-capacitance due to the "end effect" (also called
"fringe effect"). To compensate for the end-capacitance, you have to
make the physical 1/4 wave radiator somewhat shorter (to get resistive
input impedance).

Note: input impedance of quarter wave over an infinite good conducting
ground plane is about 35 Ohms (from image theory). A quarter wave fed
over 3 or 4 radials has somewhat lower input impedance.

> and 1/4 is 1/4 wl, electrically and phisically ??

You can see the 5/4 wave as "end-capacitance" + 0.5+0.5+0.25 wave.
When you make the first 0.5 wave somewhat shorter to compensate for
the end-capacitance, you will find a low input impedance (resistive),
but somewhat higher then for the 0.25 wave (due to more radiation loss
of the forward en reflected wave). On the resonance frequency, the
0.45+0.5 wave section behaves as a high input impedance, therefore the
input input impedance of the 0.25 wave section is low (quarter wave
transformer formula).

You have the length correction for "end-effect" only ones. So when you
have to cut 2cm for the 0.25 wave case, you should do almost the same
for the 5/4 wave case.

When you change frequency (starting from resonant frequency), you will
notice that inductive or capacitive component changes faster than in
the 0.25 wave case. So roughly spoken, the shape of the impedance
curve around the resonant frequency is same as for the 0.25 wave case,
but the exact figures are different.

> plane". The most technical explanation i found is that due the high
> impedance at the feed point, the 1/2 wl antenna don't care about the ground
> plane. But i'm not so convicted about this, and a basic explanation of the
> 1/2 wl "no-ground-needed" theory is appreciated.

Thin 0.5 wave antennas have high input impedance (some kOhms). So at
about 100W input current is about 0.3A, while input current for a 0.25
wave is about 2A. (difference is 16 dB).

The total impedance as seen from the coaxial feeder is the sum of the
antenna impedance and the impedance of your (floating) ground (for
example some quarter wave radials). As input impedance of thin HW
radiator is high, many commercial antennas do not have radials. They
rely on the (<< 1 kOhm) impedance of the screen of the coaxial feeder
or the mast/pole/roof structure, etc.

Sometimes your mast/pole or cable may show resonance that increases
the ground impedance as seen at the antenna base to a value not far
below 1 kOhm. This will lead to relative high RF current in mast/pole/
cable screen, and because of this, significant change in radiation
pattern.

I have a document solely on HW monopoles here:
http://www.tetech.nl/divers/HWmonopoleNL1.pdf.
It is in Dutch Language, but the comment in all graphs is in English
Language.

Perhaps I could share a few thoughts on the "missing degrees" topic; and again I apologise as the new boy if this has all been covered before! I found the following argument helpful when trying to get my head around some of the issues, and it may help others:

Picture the short, base-loaded, 6ft vertical antenna example I gave earlier which resonates at 3.79MHz with the coil dimensions I quoted. The 6ft whip represents an electrical length of about 9 degrees. Now suppose I remove the 12" long loading coil leaving a 12" vertical gap in the antenna. At this point I find it much more helpful to think in terms of a "missing" +j2439 ohms reactance, rather than a "missing" 81 degrees, for reasons we shall see later.

Now I run out a couple of horizontal wires from where the top and bottom of the coil were connected, and short them at the far end thereby forming a short-circuit stub. That stub will insert some "loading inductance" in place of the coil. How long do I need to make the stub to bring the vertical back to resonance?

Using the simplified stub formula Xl=+jZo.tan(Bl), and assuming for now that the characteristic impedance is 600 ohms, I find that the electrical length needed to generate +j2439 is 76 degrees - well short of any "missing" 81 degrees. And if I increase the characteristic impedance of the stub to 1200 ohms I only need 64 degrees. The Corum & Corum formulas tell me that the characteristic impedance of my original loading coil is 2567 ohms at this frequency, so that only requires an electrical length of 43 degrees.

So, for me, the "missing degrees" question is not really about missing degrees; rather, it's about a missing inductive reactance which can be provided by transmission line structures with a wide range of electrical lengths depending on their characteristic impedance. The "constant" is the reactance, not the electrical length.

I also find this picture helpful because I can visualize that, although there must be forward and return waves on the stub, the net current I would observe is a standing wave whose phase doesn't change along the length of the stub. Incidentally, taking 43 degrees as the length of my loading coil I would expect to see a change in current amplitude along the length of the stub of cos(43); that's 0.73 - pretty close to the 0.69 observed in the EZNEC model between the ends of the coil.

Finally, I ask what the transmission line characteristic impedance would need to be for its length to be exactly the "missing" 81 degrees? Answer: 2349/atan(81)=273 ohms. Isn't that in the right ball

park for the characteristic impedance of a single straight piece of wire - in fact the piece of wire that's needed to turn the 6ft whip into a full quarter-wave vertical?

And finally, finally, to Roy: I struggle with the "mental gymnastics" needed to move from the simple stub model outlined above, to one where the "transmission line" is a single wire, not two wires, and "in-line" with the antenna elements. If you read the Curum & Corum paper I'm sure it will be clearer to you than to me! But until I can understand it better, I content myself with this thought: if we removed 56ft of wire from our full-sized quarter-wave vertical to leave just the 6ft whip, we'd be happy to analyse this 56ft straight piece of wire using a transmission line approach (including considering forward & reflected waves, and the resultant standing wave along it), and to ascribe to it an equivalent inductive reactance. I don't understand why I (we?) find it intellectually any more difficult to take the same approach with a piece of wire once it is wound into a helix.

Regards,
Steve G3TXQ

2373. Re: Electrical lenght vs. phisical lenght

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-22 11:19:41 UTC
From: Richard Fry <rfry@adams.net>
Message-ID: <ae6d383e-71df-454a-bc1f-395130409b84@r33g2000yqn.googlegroups.com>
Source record: 16297

The electrical length of a monopole is longer than its physical length, because the velocity of propagation along the monopole is slower than in free space.

Here are some parameters for two cases of base-fed, self-resonant, 1 MHz monopoles, with two ohms in the r-f ground connection, over a perfect ground plane:

1/4-WAVE

Height = 70 meters
Width = 1.5 meters (solid cylinder)
Input Z = 38 + j0 ohms
Peak Gain = 4.9 dBi at zero degrees elevation
Number of Lobes in Elevation Pattern = 1

5/4-WAVE

Height = 368 meters
Width = 3 meters (solid cylinder)
Input Z = 63.5 + j0 ohms
Peak Gain = 7.57 dBi at 57 degrees elevation
Number of Lobes in Elevation Pattern = 3

Antenna current always is very nearly zero at the top of a monopole of every height, and distributes itself below the top of the monopole approximately in the form of a sine wave.

Monopoles of every height need a very low-loss return path for the displacement currents they generate in the nearby earth, extending out to about 1/2-wavelength. Current densities in the earth vary within that distance for monopoles of different heights, and are proportionally less very near a 1/2-wave monopole than very near a 1/4-wave monopole. But for best system efficiency a 1/2-wave monopole still needs a low-loss ground plane to work against.

An example of a low-loss r-f ground connection is 120 buried radial wires extending about one-half of a free-space wavelength in three-degree steps around the base of the monopole, and bonded together at the base. Such a radial system has an r-f loss of 2 ohms or less.

> Now, how i do treat a 5/4 wave phisical lenght monopole, in respect of
> electrical lenght ??

The free demo version of EZNEC will answer your question.
1/4WL above the 5/4WL monopole's feedpoint, there is a
current node ('x' minimum point). Of course, there is another
current node at the top of the monopole. Looking at the
monopole with your head turned 90 degrees, the current
distribution looks something like this.

```
_ __
\ / \
fp----x------x------x
\ __ /
```

Since it is fed at a current maximum point, you need
a counterpoise/ground-plane for such an antenna.
You didn't ask, but the take-off-angle for a 5/4WL monopole
is about 58 degrees, not a good idea above 10 MHz.

> The second question is about 1/4 wave vs 1/2 wave monopoles. I googled
> around, but no one define exactly why "1/2 wave antenna don't need ground
> plane".

A 1/4WL monopole is half of an antenna. The ground plane
is the other half. The feedpoint is at a current maximum
point which is a magnetic field maximum. The high intensity
magnetic field directly encountering the earth is a lossy
condition.

A 1/2WL monopole is a complete resonant antenna. The
feedpoint is at a voltage maximum point which is an
electric field maximum. A pure electric field encountering
earth ground is less lossy than a pure magnetic field
encountering earth ground. Since the feedpoint impedance
is very high, some hams simply use a ground rod for a
counterpoise.

I would also ask the questions: How much delay is there through
a series stub? What is the phase shift through the stub measured
by using the current on this standing-wave antenna? See below.

> I also find this picture helpful because I can visualize that,
> although there must be forward and return waves on the stub, the net
> current I would observe is a standing wave whose phase doesn't change
> along the length of the stub.

Someone is likely to point out that if one uses a current probe
to observe the current, it looks like a sine wave, i.e. its
phase is obviously changing with time. The point is that the
phase changes very little with length.

What we must be careful to say is that the phase doesn't change,
RELATIVE TO THE SOURCE PHASE, along the length of the stub. Here's
what EZNEC says about the phase in a 1/4WL open-circuit stub.

```
EZNEC+ ver. 4.0
1/4WL open stub in free space 4/22/2009 7:08:09 AM
--------------- CURRENT DATA ---------------
Wire No. 2:
Segment Conn Magnitude (A.) Phase (Deg.)
1 W1E1 .99665 -0.25

```

Only 2 degrees of current phase shift in 90 degrees of stub.
How can that current be used to calculate delay through the
stub?

The similarities between an antenna and transmission line have been known for a very long time and described in a number of papers. (See for example Boyer, "The Antenna-Transmission Line Analog", _Ham Radio_, April and May 1977, and Schelkunoff, "Theory of Antennas of Arbitrary Size and Shape", _Proc. of the I.R.E., Sept. 1941.) It's a useful conceptualization tool but, like comparing electricity to water in a pipe, has its limitations. If you look at the transmission line properties of a vertical, you see that the two conductors (the antenna and ground plane) get farther and farther apart as the distance from the feedpoint increases. This behaves like a transmission line whose impedance increases with distance from the feedpoint and, in fact, a TDR response shows just this characteristic. It's open circuited at the end, so it behaves pretty much like an open circuited transmission line, resulting in the same reflections and resulting standing waves you see on a real antenna. One difficulty is accounting for the radiation, which adds resistance to the feedpoint. I've never seen an attempt at simulating it with distributed resistance, which I don't think would work except over a narrow frequency range. Boyer deals with this by simply adding a resistance at the model feedpoint, noting that the resistance doesn't change very rapidly with frequency. So this is one inherent shortcoming of the transmission line analog. As long as you incorporate the increasing Z0 with distance from the feedpoint and the limitations of the resistive part, the model does reasonably well in predicting the feedpoint characteristics of simple antennas. But one shortcoming of many antenna transmission line analogies is the attempt

to assign a single "average" or "effective" characteristic impedance to the antenna, rather than the actual varying value. This is where a lot of care has to be taken to assure that the model is valid in the regime where it's being used.

There's no reason you can't also include a loading coil in the transmission line model, and Boyer devotes much of the second part of his article to doing just that. A solenoidal coil raises the characteristic impedance of the length of "line" it occupies, because of the increase in L/C ratio in that section. The traveling wave delay in that section of the transmission line also increases due to the increased LC product. (L and C are per unit length in both cases.) But don't forget the C which is an essential part of this analysis, and don't forget that the C is decreasing from the bottom to the top of the coil, resulting in an increasing characteristic impedance. A very short coil like a toroid will raise the Z0 only for a very short distance, so behaves differently from a long solenoidal coil.

Models or analogs can be very useful in gaining insight about how things work. You have to remain vigilant, though, that you don't extend the analogy beyond it realm of validity.

I'm just putting the final touches on the conversion of my well-used "Antenna Basics" talk from overheads to Power Point for an upcoming convention in Boise this weekend. Among the promises I make at the beginning are to show how to make a back yard dipole with over 4.4 dBd gain, and a three-element beam with 3 S-Units gain. But after some thought, I decided that the beam actually has 6 S-Units gain, and that's what I'll guarantee. So a 9 dB vertical is child's play.

So what? An ever increasing Z0 does not change the
basic characteristics of a standing wave antenna, one
characteristic of which is: The phase of the current
relative to the feedpoint current phase changes by
a minuscule amount. So exactly how did you use that
current to measure and calculate delay???

Strictly speaking, Cecil, if we were anything it would be a monkey's great to the tenth power nephews, but that isn't even accurate.

There was a critter some long time ago that isn't around today, from which monkeys, chimps and apes eventually evolved from.

Could a God cause that evolution? I could imagine the possibility, or at least the conditions that set it into motion. But all that is outside the realms of science.

> or the mast/pole/roof structure, etc.

Ok. Have some right input now.. so, reading also the other posters (that
here i thanks for all the inputs...), i assume that:

- thin HW monopoles have high impedance;
- by the way, high impedance mean a Z transformer, or auto-transformer, that
match the ~1kOhm Z of the antenna to the 50 Ohm of feed line;
- radials are ininfluent or useless because HW monopole is a complete
resonant antenna;

What is not clear for me is "They rely on the (<< 1 kOhm) impedance of the
screen of the coaxial feeder or the mast/pole/roof structure, etc."
What means? That because i have a complete resonant antenna the concept of
"ground" is only a concept of "Z in regard of what??" and because
pole/coax/mast present for sure a much lower Z (at monopole resonant
frequency) than the monopole itself, we (and the antenna) assume that
pole/coax/mast is "ground zero" for us ?

> Sometimes your mast/pole or cable may show resonance that increases
> the ground impedance as seen at the antenna base to a value not far
> below 1 kOhm. This will lead to relative high RF current in mast/pole/
> cable screen, and because of this, significant change in radiation
> pattern.

And if i guess right in the precedent statement i wrote, in this case
(resonant mast/pole/feed line) i lose the "ground 0" reference and in this
case i do provide a low impedance reference to the antenna. Maybe, adding
some radial. But this is my guess, i'm not sure if is the right thing to do.

First thanks for replies abt the 5/4 WL monopole, i'm trying right now to
use eznec and simulate what you saw me.
One more newbie question: 1/4 WL and 1/2 WL monopoles are both end feeded.
So my feed point is exactly at the begin of monopole.
Assuming there is no feed line, or also a 1/2 WL feed line (if IIRC 1/2 wl
is the line lenght that preserve the phase of my RF wave from generator to
the end of the line...) what decide if i'm feeding the antenna on a current
maximum point or in a voltage maximum point ?? On a dipole, with the imagine
of the wave "superimposed" to the dipole in my mind, is quite easy for me
figure out if i'm feeding it on a current node or on a voltage peak (e.g
center feed vs. off center feed dipole). But since in both 1/4 and 1/2 wl
monopoles i'm at the *begin* of the antenna, what decide the feed point
modality (I or V) ?? The impedance i have at the specific point ??

Regards,

> Dale W4OP

An isotropic antenna always has a gain of 0 dBi, by definition. Also by definition, it always radiates equally in all directions. So 0 dBi is always a fixed field strength for a given power input and distance, and this field strength doesn't depend on the presence or absence of a ground or other environmental characteristics. This constancy is what makes dBi such a useful reference. Any other antenna, such as a dipole, used as a reference should be placed at exactly the same position and, if over ground, at the same height as the antenna being analyzed.

Antenna field strength automatically increases 3 dB when you place it over a perfect, infinite, flat ground plane(*) as opposed to being in free space. That's because the radiated power is concentrated in one hemisphere rather than being radiated in all directions. The isotropic reference, 0 dBi, is always referenced to an isotropic antenna in free space, that is, one which radiates equally in all directions. So gain expressed in dBi increases 3 dB as a result. Ground reflection also modifies the antenna pattern due to reflection, so the gain increase from placing an antenna over ground is often greater than 3 dB, typically around 4 - 5. A little experimentation with EZNEC or other modeling program will illustrate this.

Which gives me an opening for one of my favorite soap box topics: dBd. If you simply accept, as most amateurs do, that 0 dBd = 2.15 dBi, then any old dipole over ground exhibits several dBd gain. The gain of a dipole relative to a dipole at the same place over the same ground is of course really zero dB. But the field strength of a dipole over ground is considerably greater than a dipole in free space (~2.15 dBi) and therefore its gain is greater than a free space dipole. This is the danger of using dBd as a reference except in free space. At least one major antenna manufacturer used this ambiguity to their advantage to give their antennas several apparent dB gain over their competitors'.

(*)A dirt ground isn't much different from a perfect ground for low angle radiation from horizontal antennas.

Then you are in agreement with Carl Marx, who left seminary school after
reading Darwin's theory

> If creation science is going to be science, it is going to have to
> produce some science.

Creation Science is only scientific in it's view and interpretation of the
problems with macro evolution interpretation. It deals with review of
existing science that has been found lacking. It is not concerned
specifically with productivity nor in generating fraudulent science for the
purpose of satisfying grant requirements.

> -.-. --.- , Cristiano, Italy

Hello Cristiano,

Please go to figure 5 of http://www.tetech.nl/divers/HWmonopoleNL1.pdf.

Look to the source at the bottom of the coaxial structure. As the impedance of the source is assumed 50 Ohms, and the cable is 50 Ohms, you may take out the source and place it between the radiator and the screen of the cable.

Then you get the circuit model in the right part of figure 5. Now you can see that the source (power comes from your transmitter) is between the radiator (Zrad) and three other impedances (that makes the ground impedance as seen from the source). So the source experiences the sum of Zrad and the three low impedances in parallel.

To avoid that the impedance seen by the source depends on the ground impedance, you want to have Zrad >> (Zscreen//Zgpr//Zgpl). For the quarter wave case (low impedance) you need Zgpr and Zgpl (impedances of two radials) to have low "ground" (counterpoise) impedance.

For the HW case, Zrad can be > 1 kOhm, in that case the radials (Zgpr, Zgpl) can be removed as the impedance of the cable screen/mast, etc is mostly below 1 kOhm.

More about the currents
For simplicity think of a coaxial feeder with solid screen far thicker then the skin depth. In such a case Ic = Isi (figure 5). Isi is pulled out of the two radials and the outer of the coaxial screen. Because in this case Zgpl and Zpgr is low (quarter wave radials) Isi is pulled out of the radials, hence you have less common mode current (Iso) on your coaxial feeder.

When you don't have radials, Isi will flow on the outside of the coaxial feeder (figure 6). As this current is as high as the radiator current (Irad), this may lead to severe problems. Figure 7 shows the situation for the HW radiator. Due to the impedance transformation, Irad' is far below the quarter wave situation, hence Iso (=Isi'). Here Iso is also the common mode current (that contributes (positively or negatively) to the overall radiation pattern of the antenna).

It is not uncommon that Irad' is about 8 times less then the current in the middle of the HW radiator.

The advantages of a HW radiator with respect to lower common mode current disappear in case of thick radiators. This is because the

input impedance of HW radiators depends on the thickness/lambda ratio.

So whether you need radials (or other provision) depends on the situation. Design goal is to get Zrad (HW case) >> Zground (Zcounterpoise).

Saluti,

Wim

Yep :)
My error is seeing RF "flowing" from my feed point only through the monopole
and up , not considering that an RF generator is a bipolar thing, and
feeding an antenna is ever related in respect both begin and end of the
entire antenna.
In case of my monopole, i simply forget about the other part of my antenna
:)
Sorry for the dumb question. Hope to ask more serious things.

Changing the ground point did not clear up the reception from the
rear!
Have made a smaller antenna (not for top band) and mounted on a
framework on the ground. Same thing happening but band does seem
squirrily!
Have put a tilt mechanism on it and I am working on putting a rotator
on it so that I can get a better feel on things. I was going to do

this anyway as I want to see what this arrangement has on TOA. If
radiation is a matter of charged particles then penetration of dish
would change the direction of gain.....food for thought
The group can now go back to the subject of change
Regards
Art

I just figured out how to weld brass, so I'm building a VHF 1/4 wave vertical with some 1/8" brass rod bought at the hardware store.

I made a circle big enough for one of those VHF connectors with the threaded body, and welded 4 pieces to it act as the radials. I then filed down the end of a brass rod small enough to solder to the center conductor of the SO-239. I'm going to cover it in epoxy for strength and to keep the water out.

My question is: Will this be durable mounted outdoors? Is there a reason why brass isn't used much for antennas? What about epoxy? Am I asking for trouble here?

Brass is heavier and more expensive than aluminum in general, so isn't
much used below UHF.

It is easier to solder to and make physical connection to than aluminum.

I've made a number of UHF antennas out of brass brazing rod and never
had a problem.

FYI, it is easier to make adapters from hobby store brass tubing than
it is to file things down.

Tubing also makes a nice extension to the rod to fine tune the length.

After your brass/copper/bronze antenna has been tuned, etc., clean it up
well, let it dry and then spray it with Krylon clear paint. The Krylon will
prevent a patina from forming any time soon and will keep your metal shiny,
if it was shiny to begin with.

Wherever men see themselves as the authority, there is potential for
corruption in any institution. My beef is not specifically with science,
but with the arrogant who seek to re-engineer everything in the world to
their own ideal, including American society and world climate, heedless of
the damage. Is Christianity such a threat that hysterical administrators
should throw people out of school for praying, or to utter the name of
Jesus?

Oh to have the insight of Joseph or Daniel.

Let us take "Global Warming" for an example. The environmental storm
troopers are all set to institute great changes and restrictions on the way
we do business in an attempt to "correct" climate change. This might be a
good thing if it can be done without harming the economy. Why? If you will
notice, the major environmental damage around the world exists in
impoverished nations where the population lives for the day at the expense
of the future. It is a good thing to be wary for the environment if you can
afford the luxury of it. Climate change might be a good thing if we were
completely aware of all of the causes and results of it. But all
indications are, if the human race can't even reduce wasteful and hazardous
use of resources, any idea of intervention beyond that could only risk
overcorrecting since anything that can actually be set into motion seems to
have to progress to near disaster before we change course.

The Bible is a great study of the folly of man, and the only Hope for salvation.

If you look at the word "day" as it is used in the Hebrew language in the
OT, it means in almost every instance, a literal day. So why would we want
to imagine that it would mean anything else when the Bible is pretty clear.

A 1 foot diameter helix would be a design for the 1 meter band, not 160.
You need to scale it up just a bit.

The diameter should be about 50 meters. The reflector should be maybe
150 meters in diameter. This is not going to fit in your back yard.

My beef is not specifically with religion, but with the arrogant who
seek to re-faith everything in the world to their own dogma. I won't
expand on "including" American society and world climate because that
is already explicit in "everything in the world" unless, of course,
there is some divine perspective that combines American society and
the world climate that is unshared with "everything in the world." Is
science such a threat that hysterical pulpit pounders should
excommunicate people for embracing an irrational Pi, or because
Einstein was a Jew just as much as Jesus was?

>Oh to have the insight of Joseph or Daniel.

Or any number of others....

Less than subtle holocaust framing.

>are all set to institute great changes and restrictions on the way
>we do business in an attempt to "correct" climate change. This might be a
>good thing

In light of the frame built around this picture, I doubt the sincerity
of what this "might be."

>if it can be done without harming the economy.

The only indestructible economy ran behind the iron curtain for 70
years. In the same span of time the western economy suffered many
plunges that wrecked it and the Commies smiled in their infinite
wisdom. So much for shedding tears over harming an economy.

>Why? If you will
>notice, the major environmental damage around the world exists in

>afford the luxury of it.

Doing nothing is vastly more expensive. The luxury card is
narcissistic.

>Climate change might be a good thing if we were
>completely aware of all of the causes and results of it.

Another limp sincerity in that "might be."

If the Qur'an has no hope then the gospels have been discarded in that
statement. The Torah, likewise. The Bhagavad Gita possibly
end-arounds these dismissals - but easily speaks to the issues.

Tom
What you say it should be is guided by conventional teachings and my
designs are not conventional. Per conventional teachings it would be
very large indeed which is why my design has to be different Actually
I want to see if I can lower the conventional take of angle with the
use of tipping mechanism plus the rotator addition.
With CP I may lose a bit of S meter readings but if I can lower the
TOA with the antenna on the ground that will be a big step forward.
Any way the antenna doesn't know that it should not work and despite
your comments it works OK, but as yet I have not been able to
establish the radiation patterns. So I have a antenna at around 30
feet and the other on the ground with a tipping device so the up
coming tests should be interesting.
Both antennas will cover top band and of course will have gain, but at
the moment it is TOA that I am concentrating on, after that it is
patterns
It is the journey not the destination.
Regards
Art

Ok. So what have you changed from a standard helical design that makes
it "not conventional" ?

Your original description sounded pretty much like a stock 1m band
helical, so if you've done something to pull it down 160:1 in frequency,
I'd love to hear what it is. It must be simple and obvious, because you
didn't mention it in your post.

Tom
I tried to share and I started with Gauss's law of statics. I never
really got into it hard because of the reaction to the first step.
Without an understanding of that first step it becomes impossible to
move further. Yes, I have made comments beyond that point but I also
left out certain factors because my work is not complete. The bottom
line is that the new antennas have been made and meet my expectations
up to this point but I have more to do. This group is not for antenna
debate it is for gottchas
by those who perceive themselves as experts and beyond the point of
debate.
Now I accept the group for what they are while enjoying my
achievements on the side.
As for you telling me what I need to do with respect to axial mode, I
know my own needs better than you.I think you will be better off
listening instead of posting starting with what Cecil has to say and
the difficulties that you are having in digesting.
Regards

Art

The Z0 characteristic impedance that matters is the
one that exists at the coil-stinger junction which
can be estimated from the single-wire transmission
line Z0 equation. It's usually in the neighborhood
of a few hundred ohms. For instance, a #14 horizontal
wire at 30 feet has a Z0 very close to 600 ohms
according to the formula.

> One difficulty is accounting for the radiation, which

I have simulated such using EZNEC's wire resistivity
option. The resistance wire simulates the radiation
"loss" from the antenna. But for a standing wave
antenna, the "loss" to radiation is only about 20%
of the total energy stored on the standing wave
antenna. Therefore, a qualitative conceptual analysis
can be done assuming lossless conditions just as it
can be done with transmission lines.

Seems EZNEC automatically compensates for the varying Z0
so all we need to estimate is the single effective Z0 at
the coil to stinger impedance discontinuity.

Are you saying the physics of the delay through a loading
coil changes between a traveling wave and a standing wave???
The standing wave is composed of a forward traveling wave
and a reflected traveling wave. They would experience the
same delay that you are talking about above.

So why didn't you use a traveling wave to measure the delay
through a loading coil??? Exactly how can the following
antenna current (from EZNEC) be used to calculate delay? The
current changes phase by 2.71 degrees in 90 degrees of
antenna. If the antenna was lossless, i.e. no radiation,
that current would not change phase at all.

Cecil
The problem in this debate is that others are concentrating on
resonance
where as you are thinking in terms of anti resonance which portends to
a higher impedance and also the condition of equilibrium. When
considering the boundary law
one must recognise that momentum increases and decreases twice per
period. Thus when considering the boundary laws the negative area of

the sine wave must be placed underneath the positive area such that momentum is taken account of.
When the diagram provided by Best on this thread was shown what it described was the period was extended by the containment within the boundary and where that containment extended the period which is now longer than the period of non containment.In one case you have accelleration and deaccelleration which is depicted
as the emmission of energy or flux. Consevation of energy laws demands that for balance we must take into account the energy or flux that enters the boundary to maintain equilibrium which is depicted by the negative area of the sine wave period
such that this area is placed directly under the positive area while still remaining within the arbritrary boundary. Thus we have effectively changed the period when looking at a coil where the slow wave is now half of the original wave as is theresonant point is half of the anti resonant point which in terms of Newton and Maxwell represents the point of equilibrium. When using the resonant point in terms of relativity ie Maxwell you are seeing movement of a charge from "a" to "b" which when repeated is repetitive movement in a single direction. When using the anti resonant point the charge returns to the starting point and if time is regarded as /dt
then the charge only moves in the vertical direction. Thus in terms of Earth mass consists of energy movement in the ":z" plan and with respect to the Universe the energy movement is solely in the "x" or "y": direction until this action is equated with an action from the opposite direction as per the law of Newton. Thus like Einstein viewing the same action of Newton this thread is viewing the same problem where one is static and one is relative but never the less the same problem but relatively different. Pure physics my dear Watson viewed fron different vantage points., one takes equilibrium into account where as the other doesn't.
Not "babble"' David just an explanation per classical physics which is the sole and only root of both mechanical and electrical engineering
Best regards

I apologize if I gave you that idea, Art. I am talking
about a physically short (38 degrees), electrically 1/4WL
(90 degrees) *resonant* antenna over mininec ground. The
feedpoint impedance is low and resistive.

In the example given, the stinger supplies 19 degrees
of phase shift, the base-loading coil supplies 19 degrees
of phase shift, and the impedance discontinuity between
the coil and the stinger provides a point phase shift that
makes up the difference between 38 degrees and 90 degrees.

As I hammer away at this concept, I am wondering if a
loaded mobile antenna can be optimized if only the correct
model is adopted. Is a high-Q loading-coil always better
than a loading-coil with a lower Q? Are fat/short loading-
coils always better than skinny/long loading-coils? Some
field measurements have cast doubt on some long-held
concepts.

But obviously the question cannot be answered as long as
some people insist on using the lumped circuit model for
the loading coil, e.g. virtually zero delay through the
coil.

I have measured the delay through a 75m bugcatcher coil.
It was approximately 25 nS, a magnitude greater than
w8ji's "measurements". It doesn't matter if my measurements
were off by 20%. The magnitude difference between my
measurements and w8ji's "measurements" is too significant
to be ignored.

Roy: I understand what you are saying. But the derivation of
Characteristic Impedance in the Corum Bros. paper depends only on the
coil dimensions and number of turns; it is independent of any
relationship to other conductors or groundplanes. I also note that
ON4AA's inductance calculator predicts the "Characteristic impedance
of n=0 sheath helix waveguide mode at design frequency" based purely
on the coil geometry. The maths is a bit beyond me (trying to solve
Maxwell's equations for a solenoidal helix), but seems to bear analogy
to the derivation of the characteristic impedance of a waveguide.

I'm inclined to try to understand it better, because it's this derived
Characteristic Impedance, along with the axial Velocity Factor, that
generates the reactance values which seem such a good match to
experimental and modelled results.

Steve, you will find some old-fashioned concepts here
based on the lumped-circuit model rather than the
distributed network EM wave reflection model. One can
easily disprove the assertion that a single wire
in free space doesn't have a characteristic impedance
by asking the question: Does a single electromagnetic
wave traveling through free space (without a wire)
encounter a characteristic impedance? If so, why doesn't
a single wave traveling through a wire in free space
encounter a characteristic impedance? Of course, the
ratio of the electric field to the magnetic field,
whatever that turns out to be, is the characteristic
impedance of a single wire in free space. It, like
the characteristic impedance of free space, seems
to be a few hundred ohms.

There are lots of old wives tales asserted by the gurus
on this newsgroup. One must be careful what one accepts
as technical fact.

"A single conductor doesn't have a characteristic impedance."
is a preposterous assertion. If free space itself has a
characteristic impedance, what are the chances that a
single wire in free space would not have a characteristic
impedance??? Zero, at best??? :-)

Some will say: "Where is the return path for the current?"
I will respond: Where is the return path for the "current"
arriving from the Sun that can be captured by a solar
panel? Good Grief!

Cecil: that's a VERY significant result. If I feed the dimensions of W8JI's coil into Equation 32 in the Corum Bros paper it predicts an axial Velocity Factor of 0.033. That would equate to a time delay of 24.7nS across the 10" long coil !!!!

Of course, you mean *0.033* for the VF of w8ji's coil which
was 10tpi, 100turn, 2" dia.

10"/12/0.033 = 25 feet equivalent to straight wire.

The VF of my Texas Bugcatcher coil is 0.02. It has 4tpi,
26turn, 6" dia.

6"/12/0.02 = 25 feet equivalent to straight wire.

These two coils have essentially equal delays at 4 MHz.
They are each very close to 0.1WL, i.e. 36 degrees.

The delay for one wavelength at 4 MHz is 250.5 nS so
each coil would have a delay of 1/10 that value or
25 nS. Everything fits the model.

> 73, Cecil, IEEE, OOTC, http://www.w5dxp.com

Exactly. !/4WL is not in equilibrium,a full wave length is and that is
where you are argueing past each other. Radiation is the accelleration
of a charge or a particle of energy. A half wave accelerates a charge
and the second half replaces the static particle that created the

facilities for the next radiation or application of charge.
If you only use a portion of the period then you are messing with the speed of light.
The speed of light is the time it takes for a magnetic field to be produced and the time
it takes for a magnetic field to decay which also equals the time that it takes for an electric field to be formed and decay the sum time of both being a period or the speed of time. Thus a WL is equal to equilibrium and less than that is not. Maxwells laws are valid ONLY when equilibrium is present, thus the quarrelling between the two parties.
Embroiled in the middle of that is the misconception of standing waves.
A charged particle changes direction and then returns to the starting point to constitute
a full period. If you have a 1/4 wave the charge continues its direction until half a period has passed and only then can particles be collected for sunsequent acceleration and radiation. So for half the time or 1/4 of the time for a 1/4 WL is the radiating at an angle i.e the addition of two vectors,forward and displacement current,
the rest of the time the remaining charge is the accelleration of the charge continuing
off of the end of the radiator (not bouncing back) where the energy is seen as a spark
or straight line radiation. So Cecil the debate in fact is over a series of misconceptions resulting from the omission of equilibrium which makes both sides of the debate invalid.
Regards
Art

Hi Steve,

You're right. The numbers are amazingly close - almost as if his
'experimental apparatus' had calculated the result rather than measure it.

Cecil, reference you comment that a straight wire does NOT have a
characteristic impedance, this is one place where you misunderstanding
things. A charge rests on the surface and when it is radiating it
instantly is removed from the surface by the displacement current in

coordination with the applied current. If the radiator is not a full wave length there is no surface for a displacement current to exist thus the direction of charge is not elevated away from the surface but continuing the parallel to the surface direction which is the observed as "end effect"
If the concept of a bounce back of charge was maintained then the amount of charge
must also change as time revolves around a full period where eventually the charge
totally reaches the scource when the bouncing around coincided with a period.
Thus if the charge is in "standing wave" form the impedance changes during every circuit of the charge back to the source and that can never be. Characteristic impedance is that seen only with a closed anti resonant point or in other words at the point of equilibrium which is represented by a period.
Looking at things from a different angle, when the time varying field becomes a constant which is then the application of DC then you have a tesla coil where the spark or energy and thus radiation is parallel to the conductor and where the period covered by over shoot, a one time event, where radio radiation is shown by the area of the curve during the time of that event.
Best regards
Art

Jim, thanks for the reference.

Perhaps I should have expressed myself more clearly. What I've not seen, for example, is a lumped-element analysis which takes just the coil dimensions as input, and predicts theoretically - without a lot of empirical "tweaking" - the reactance at a particular frequency; particularly a frequency close to self-resonance. There may be one out there, but I've not yet found it!

In contrast, the ON4AA calculator - based on Corums' transmission-line analysis - does just that, and produces results which seem to match well the EZNEC modelling results.

I'm not sure who the peers are who did the review, but the main thrust of the paper is that the Cambrian period, in which differing life forms proliferated, did not have much in the way of transitional fossils before it happened. The life forms were too complex.

An explosion of new life forms after the Cryogenian is not terribly surprising, given that the earth was largely in a deep freeze during the Cryogenian.

The Ediacarian, which happened before the Cambrian, was in fact the time when many of the basic body plans that exist today came about. It recieved a bit of short shrift in the paper.

But what is interesting is the conclusion. There are some questions and interesting things about the Cambrian. We don't know everything for sure. He concludes the answer is that it must be designed. I look at it and say thanks for the idea for new research projects.

>> Here's a good idea. Instead of taking peoples money and trying to get
>> ID insertd into schools curriculum, take that money and do good research!
>
> Well, the research is out there. It seems to me that the darwinists
> dont want to even allow their science to be scrutinized.

No conspiracy needed. Let's take another and similar issue, that of Cold Fusion. When FLeischmann and Pons announced their discovery, a lot of researchers flocked to reproduce thier results. They couldn't, and cold fusion (at least at that time, was relegated to the back pages. The internet is a haven for people who say that researchers were stymied or discriminated against if they showed any evidence suggesting cold fusion

was real. And yet research goes on, if quietly. If someone comes up with cold fusion, they will be a part of history.

IF I were a biologist, and IF I thought there was any chance that Evolution wasn't real, you can bet your life I would be doing research to find out the truth. The person who discovers that will completely Rcck the entire scientific world to it's very core. And there are plenty of people out there would be willing to do the research.

But the problem is that basic research that disproves evolution is just not there. And looking at a lot of different papers and drawing a conclusion is only step one. Now that your author has made his conclusion - actually a hypothesis - synthesized from a number of other papers, he has to act on it.

The main conclusion is that the complexity of Cambrian life forms is beyond what is possible without purposful design. I would disagree, given what happened in the ediacaran age, but disagreement is how science moves forward.

Now they have to prove that

1. There are no transitional fossils

2. Come up with an adequate explanation of the lack of modern species in the fossil record.

3. A "killer" would be to find anatomically identical animals along with extinct of the same species in some provable ancient strata.

Now there is a danger in field research of item number one. Over the years, the number of transitional fossils has grown quite a bit. The Ediacaran and early Cambrian is a buzzing field at present, and there may be more transitional animals to be found.

Cecil,
You based your proof of a magnetic wave in a vacuum but it is an
accelerating charge
which obviously must have mass, that is radiation ala the particle.
If you have a Tesla set up in a vacuum the speed of the particle/spark/
light is the approximation of the speed of light.(I say approximation
since I am using the metric
of Earth's vacuum and not that of the Universe) The velocity factor is
the true ratio of the mismatch with the travel of a electric current
on Earth with all its relavent factors and comparing it to the speed
of light in the average metric of vacuum of the Universe.
Bottom line is particles are part of radiation as is light, "waves"
are not involved other than a bevy of particles separated by a
fraction of a period.

Of course if the research is repeatable, we should have rebuilt the dinos
because we would be able to create life, recreate life, and transition it as
well. We have lots of conclusion upon conclusion upon conclusion. As with
many theoretical belief systems, we construct intricate theories upon

preconceived notions.

We don't know what gravity is but we take note of it's existence. So we construct intricate theories, but don't really know if some breakthrough will suddenly make it all clear.

We have evidence of miracles, although they are often not repeatable nor observable to a peer group. We have C14 dating that is corroborated by Geological Strata theory, but Geological Strata theory is not reliable because we assume that the Earth has been re-arranged significantly in ways we can't always explain.

I prefer to leave some things unresolved and let others devote their lives to their pursuits, but I take issue with God hating mad scientists seeking to rule the world, or enabling evil. There are those who have decided that there is no right or wrong, heaven or hell, no evil or morality and that it would be just as well if a whole lot of other people could just be food or step off the planet to leave more for the animals.

I leave it in God's hands though. He does what he wants.

That is because the transmission line is considered to be within a
arbitrary boundary
where all applicable forces equals zero, ie in equilibrium. Eznec is
also based on the condition of equilibrium as applied by Maxwell in
concert with Newton.
This group is using the conditions accounted on this Earth where as
scientific laws are based upon a Universe within a boundary and not
just the Earth. TRhat is equivalent to saying weight is the same
metric as mass !

EZNEC is a mathematical model just as the transmission line model is
a model. EZNEC doesn't use a transmission line
analog in order to reach its conclusions. If you're really interested
in this subject, you have to read Schelkunoff and others who did the
research on this years ago. A big, honking loading coil doesn't
act much like a lumped component. It makes a pretty shabby transmission
line, too. If you want to understand it, you have to study
electromagnetics and approach it from that standpoint, which may not
be easy. Finally, a modest question: if you have EZNEC, why would you
be wasting time with something inferior? The gold standard is the gold
standard. Or are you on some philosophical quest, like Cecil?

When students perform an experiment to proove the laws of Nature it
really does belittle seeing is believing. To change the statistics of
what we are seeing which is the situation on Earth, this alludes

the"relative" term of Einstein, then to bring what we deduced by seeing by the conversion of weight to mass. This correction thus brings in to focus what Einstein meant by relativity because it depends on the gravitational pull relative to what part of the Universe the experiment was performed. What we term as Classical physics is the behavior of the Universe and the laws that govern it. Thus mass is the carrier of potential energy where decay is synonamous with the break off of a particle which contains a portion of the potential energy where the brake off is the decelleration of the partical when it enters a different gravitational field
and thus turns to kinetic energy and where this change is seen as light i.e Kinetic energy that is transformed to heat which also governs light. Thus when considering
a perfect conductor ie zero resistance which is also a measure of the datum level of zero movement of electrons within mass there is zero movement within mass to affect the passage of current and thus the current travels at the speed of light. When temperature in not at the datum level it is the movement of electron within mass that provides the resistance to current flow and thus we have what is known as the "velocity factor", and it is the circular movement of displacement current which is also a movement of current flow that applies what we know as displacement current.
Thus there is a Universal law of nature because all things revolve about the relative movement of particles compared to that of a static particle which if the change is instantaneous we have what Hawkings calls the BIG BANG.
All of the above emphasises where all the participants of this thread are argueing about the same problem but from different relative positions within the Universe

Lesson.
All scientific debate is correlated to the whole of the Universe and not the metric datum of vacuum as represented by the size of a arbitrary fieldwithin the Universe
This is what is meant by CLASSICAL PHYSICS.
Enuff said.

I doubt the sincerity
> of what this "might be."
You got that right. Just exercising a line of thought.

If the Soviet economy was indestructible then it's only because people weren't. You have made my point about mad scientists, and now philosophers and other intellectuals too, considering the world holocaust that way overshadows the Nazi atrocities. It is interesting that it is always so fashionable to beat Hitler, the Monster, over and over while Stalin, Uncle Joe, and many others of his kind keeps getting a free pass.

What makes you think you wouldn't be so easily expendable as well. There would be no need for those who demoralize and destabilize after the crisis unless to maintain the crisis away from home. KGB made that policy. Notice that the "Labor Union" was the Government, Employer, Management and owned all the money, food, housing too. Call it State Capitalism or Imperialism.

If the US and the Whole World economies and environment are destroyed, it will be because of everyone trying to get something for nothing. Not a good thing for anyone to get something for nothing, nor to be envious.

Let's see how well the principles involved are understood.

What is the delay through a physically very small toroidal coil with the same inductance as the solenoidal coil? Why?

Why do you say "approximately 25 nS" and 24.7 nS are
amazingly close? "Approximately 25 nS" might include
an unknown measurement inaccuracy.

That quote was not mine, Art, it was Roy's. My argument
is that since free space itself has a characteristic
impedance then a wire in free space must also have
a characteristic impedance and act as a waveguide
of sorts.

Tom,TomTom.
Eznec DOES use the transmission line analogy because like Gauss it
uses an abitrary border where the contents are in equilibriumn or in a
state of balance where all forces are accounted for when a time
varying field is applied. The same goes for a transmission line where
the radiation factor is also accounted for.

The radiation force losses are accounted for by the depreciating impedance with time
which is also shown by the deprecating amplitude of occilation where each period loss of amplitude represents radiation energy. If the amplitude showed no change then you have a tank circuit without friction or other losses. No losses means perpetual motion and vica versa. If on Earth friction is always there which is also equal to the energy for an acceleration of a particle. On the reverse side, a deccelerating force on a particle represents kinetic energy as opposed to the potential energy supplied for radiation where the product is seen as light. As with a light bulb radiant heat is what we know as light. Just classical physics no less

Tom,

Yes I have EZNEC and recognise what a great tool it is. Its
predictions were the benchmark against which I tested the various coil
models I read about, and no-one has yet suggested that it can't be
trusted for modelling a helix.

I'm not on some "philosophical quest" - I'm just an old, retired, guy
who still likes learning and wants to understand more about how things
work; I hope that never leaves me! I stumbled on this discussion quite
by chance and tried to understand the various "positions" being taken.
Perhaps I'm over-simplifying, but it seemed to me there was a group
who favoured the transmission-line model and a group against it. I've
tried dispassionately to understand the various arguments and to form
my own conclusions.

Now here's my problem:

* The results I get using a model based on transmission-line analysis
are very close to my EZNEC predictions - not perfect, but way better
than any lumped-element analysis results
* I don't see quantitative, non-empirical, arguments being put forward
to support lumped-element analysis
* I see numeric arguments being put forward by Cecil to support a
transmission-line approach - they look convincing to me and, although
I see a lot of unpleasant personal attacks on him, I don't see any
scientific challenge to his figures
* On the other hand I see folk whose work I rate highly, seemingly
willfully to misunderstand some of the points which Cecil puts forward

Please don't think I'm trying to defend Cecil - I wouldn't be so
presumptuous, and anyway he's old enough to look after himself! I'm
just trying to understand why, what seems to me to be such a
persuasive argument, generates such opposition. Either there's some
glaring technical error here which I haven't yet spotted, or perhaps
there's a long "history" between various "personalities" of which I'm
ignorant?

Still confused,

Steve G3TXQ

I don't see where that calculator gives the Z0 and VF
of the loading coil so I have generated an EXCEL file
that gives those two parameters based on the formulas
in Dr. Corum's IEEE paper. Note that 75m loading coils
are slow-wave devices with a VF in the neighborhood
of 0.02 for a Texas Bugcatcher coil or 0.033 for w8ji's
skinny 10 TPI, 2" diameter coil.

Perhaps more the silver or electrum standard.
EZNEC doesn't do dielectric loading, for instance. (unless you get the
Nec4 engine from Roy)
And, it's a MoM code, so things not well represented by collections of
wires aren't necessarily modeled well.

A toroidal coil retains magnetism via hysteresis versus zero
hysteresis for a coil made of a diamagnetic material. A coil is in
equilibrium because all forces are accounted for
over one or more periods. A toroidal coil is not in equilibrium
because the energy that provides the hysterisis happens only once per
unit of time where as for equilibrium that same energy is provided for
every period and cancelled by same.
If a unit of energy is supplied to a radiator in equilibrium then the
unit of energy must be added to or increased to represent the
hysteresis lossesof the toroid The ratio of the original unit of
energy will represent the difference in time or delay required to
represent balance between the two. The above is based on a coil in the
medium of air and not magnetic core as the term "solenoid" suggests.
Roy doesn't see my posts either so somebody else has to pass this on.
Art

The accelerating charges are slow-moving electrons.
The RF current moves at the speed of light in the
(conductive) medium. Therefore, the RF current is
associated with photons emitted by the electrons.
Photons have zero rest mass and zero electric charge.
Photons are the particles associated with RF waves.

Source record: 16120

Hi Owen

I would like to put a question regarding a previous discussion.

Not having your e-mail address, I have to catch you on another thread.

I report below what you wrote at that time:

QUOTE
From TLLC, the matched line loss in dB of LMR400 (a foam coax of similar OD to RG213) is
3.941e-6*f^0.5
+1.031e-11*f
The first term is due to R and the second due to G.

At 144MHz, the percentage of power lost per meter due to R is (1-10^-(3.941e-6*f^0.5)/10)*100 is 1.08%. If you do similar for G, the loss is 0.034%, so loss in R is more than 30 times loss in G
UNQUOTE

I put those formulas on a spreadsheet, but I only obtain the 0.034% figure if I change the second formula into +1.031e-5*f (instead of +1.031e-11*f)

Any comment?

Thanks and 73

Tony I0JX
Rome-Italy

Roy Lewallen wrote:
> What is the delay through a physically very small toroidal coil with the
> same inductance as the solenoidal coil? Why?

A toroidal coil cannot be modeled using the Dr. Corum
formulas. But I will take a stab at the answer.

In a physically very small toroidal coil, all the
turns are tightly coupled, i.e. the flux caused by
one coil links all of the other windings so the
delay should be quite small. In any case, one
cannot use a current with unchanging phase (referenced
to the source phase) to calculate the delay through
anything. The only phase information left in a
standing wave is in the magnitude. If the current
magnitude at the bottom of the coil is 1.0, the phase
shift is the ARCCOSine of the current magnitude at
the top of the coil for a base-loaded resonant
antenna. Actual phase measurements on the current
in standing-wave antennas is meaningless. We already
know it hardly changes at all with length. EZNEC
confirms that statement.

In an air-core solenoidal coil, like the one w8ji
used, the flux linkage tends to be associated with
adjacent turns so all the flux does not link all
the coils. Tom's coil was 100 turns, 10 TPI, 2"
diameter. The first turn was 10 inches away from
the last turn. The delay through that coil calculates
out to be about 25 nS.

If we setup a 2" transmit coil and a 2" receive
coil 10 inches away in air, the energy transfer
efficiency would be very small. I don't have a
formula for such but I assume one (or more) exists.

Bottom line: There are now formulas for calculating
the Z0 and VF of large air-core loading coils which
are known to be in the family of *slow-wave* devices.

I doubt that a toroidal coil is in the family of
slow-wave devices.

There aren't many people who would support a lumped-element analysis on this newsgroup. Most people know the limitations of using network theory in these circumstances. The technical arguments against Cecil's approach were offered a long time ago. This latest is just a flareup that will soon die down. You shouldn't be confused. The transmission line model of antennas is well accepted and hoary with age, particularly for bi-conical antennas (see Schelkunoff). There are a couple of other types of models with equal validity. If you really want to know the physical score, though, you have to get an electromagnetics text that discusses the integral equations that govern antenna behavior. Pay particular attention to the parts that explain why numerical methods like EZNEC have to be used for solutions rather than the symbolic math most people would expect and want.

Some of your questions can be answered by doing a google groups search of this newsgroup for the topic "Current in antenna coils controversy" in 2003. There are several other lengthy threads at later dates, such as "Current across the loading coil - from scratch", "Loading coils; was : Vincent antenna", "Standing-Wave Current vs Traveling-Wave Current", and a number of threads prior to 2003.

I have reported no precision - my 100 MHz scope has
not been calibrated since I retired.

It doesn't take much precision to know that there's
something wrong when two measurements are a magnitude
apart or when someone asserts a 3 nS delay through
a 10 inch long slow-wave solenoid coil with a VF of
0.033. :-)

I did and do support lumped element analysis for a very small toroidal loading inductor, and extensively posted the reasons why in this newsgroup about six years ago ("Current in antenna coils controversy", 2003). Cecil and Yuri were arguing that the coil would replace some number of "degrees of antenna" and its current therefore would have a substantial phase difference between input and output ends. I made and posted careful measurements to support my statement, after which Cecil invented his "standing wave current" and went off in various directions.

Ok, firstly, there was a mistake in my formula... it is missing a pair of parentheses, and should be (1-10^(-(3.941e-6*f^0.5)/10))*100.

That correctly finds 1.08%/m for R loss.

From my spreadsheet check, =(1-10^(-(0.00000000001031*f)/10))*100 correctly calculates 0.034%/m. Note the exponent of f is 1 in the G case.

Apologies for the parenthesis omission. I wrote down what I 'did' on an RPN calculator rather than copying an expression that evaluated properly.

Does this answer your question?

All program types, including the demo, of EZNEC v. 4.0 and later do dielectric loading similar to NEC-4. (The method came from sources other than NEC-4.) Like the NEC-4 implementation, it's of limited accuracy and usefulness -- it's really good only for thin wire insulation of moderate permittivity.

Absolutely true. And it can't handle things like patch antennas or antennas printed on a PCB.

I'll say one wound on a magnetic core, simply to keep the size small, the coupling tight, and the field confined. I don't, however, care how long a piece of wire it's wound with.

Roy, I've glanced at some of those references and it looks like
there's years of "catch-up" reading for me :)

It seems like the starting point for one of the earliest discussions
was whether or not there is a variation in current amplitude along the
length of a loading coil, with some pretty strong opinion saying that
there isn't. I don't want to go over old ground, but perhaps you can
give me a simple answer to this one question:

When I use EZNEC to model a 6ft whip above a loading coil (40T, 6"
diameter, 12" long), and look at the current distribution across the
coil at the resonant frequency of the antenna (3.79 MHz), I see 1A at
the base of the coil increasing to 1.07A at the centre of the coil and
then dropping to 0.69A at the top of the coil. My question is: "Can I
believe that I would see a similar current variation in the 'real
world', or is this some failing of EZNEC to model the antenna
properly?"

Regards,
Steve G3TXQ

Yes, you would see this in the real world. EZNEC does a very good job of modeling a wire antenna with a loading coil, provided that you model the coil as a wire helix rather than lumped "load", and you can trust the results. As I've implied, a lumped load is quite a good model for a physically small, essentially non-radiating loading coil like a toroid on a magnetic core.

Cecil there you go again with the idea that zero mass and zero energy
is something that can exist which some have termed as "photons"
Point to the laws of nature that support that notion. At one time it
was the same
as a particle without mass. Presence science now state that particular
particle does have mass which is why the World spent millions for the
CERN project. Your technical expertise is built on the state of
science 50 years ago and you are now building a castle on sand or
excuses to justify your unwillingness to embrace change. It took 7
days to build the Universe by the initial expenditure of kinetic
energy which embraces the laws of nature and the concept of a cycle or
equilibrium. Remember the words" let there be light" which aligns with
energy expenditure upon mass ie everything starts with the expenditure
of energy upon or from mass it is not a chicken or egg analogy.
And it is expenditure of energy upon mass that makes it a particle
unconnected to all
mass around it such that the particle is unbound and cannot be
absorbed by another state. Lets face it, Adam and Eve knew nothing
regarding equilibrium and the notion of frequency or period. All the
work had been completed way belong that came upon the scene,, which is
why religeon exists as the sole explanation of who and what was and is
in charge with respect to the laws of nature. Again it is impossible
for something to exist without mass.

NEC (in whatever form) might give a good estimate of the inductance of some helices, although many practical inductors require smaller segment lengths that would normally be advised for NEC models, but it does not provide a good loss estimate in many interesting cases.

My post news:Xns9BE2B7AD962CBnonenowhere@61.9.191.5 entitled was about that topic, and apart from Jim's suggestion of a sensitivity analysis, there was no solution to evaluating the effective resistance of an inductor of closely spaced turns (so proximity effect is signficant) made from a braided round conductor and with a thin dielectric jacket. All three of these factors are, as I understand it, not modelled in NEC-2.

This is so wrong. The term "wave" is an adjective and a "particle" is
a noun. An adjective is the enunciation of a function that describes a
noun.

Precision is the number of sig figs. You "might" have calculated three,
rounded up, and reported two.

I didn't invent "standing wave current". Standing wave
current is what EZNEC displays for standing wave antennas.
Standing wave current is what Kraus describes graphically
on page 464, Figure 14-2, of "Antennas ...", 3rd edition.
Standing wave current is what Ramo and Whinnery describe
mathematically in "Fields and Waves ...".

It has been at least 5 years since I explained why
the phase of the current on a standing wave antenna cannot
be used to determine the delay in a wire or in a coil.
EZNEC, Kraus, Balanis, and Ramo and Whinnery all agree
with me and disagree with you. I explained, 5 years ago,
how the magnitude of the current can be used to calculate
the delay through a coil. All my explanations fell on
deaf ears and you called them gobblygook, or some such.

Once again, most of the current in a standing wave antenna
is of the form,

I = Imax*cos(kx)*cos(wt)

For any given time = t1, the phase of the current all up
and down the antenna does not change with x. The phase
is the same at the feedpoint, at the bottom of the coil,
at the top of the coil, and at the top of the stinger.
The phase of that current cannot be used to calculate
delay in a wire or through a coil.

You once said you were quick to admit a mistake. It has
been 5+ years since you made that conceptual mistake
and you have not admitted it yet.

FYI Steve, five years ago I showed Roy how to estimate
the phase shift through the coil using ARCSIN(0.69) =
~46 degrees. To this day, he refuses to acknowledge
what EZNEC is telling him about current on a standing
wave antenna which is: A current phase measurement
on a standing wave antenna is meaningless. Here's a
couple of graphic that illustrate what I am saying:

http://www.w5dxp.com/coil.gif

http://www.w5dxp.com/phasor.gif

These graphs are very close to your measurements
above.

> Steve G3TXQ

Steve.
To determine the accuracy of Eznec first requires the use of a program
with the ability to change input so that it relates to the
requirements of Maxwell' radiation laws This means a program with an
optimiser function which adheres strictly with Maxwells laws and its
applicability produced which means all forces are accounted for. You
have then established a datum line for a radiator where all forces
are accounted for per Maxwell. When that final configuration per
Maxwell' laws emerges one should be able to insert this same
configuration into Eznec to check to see if all relative factors are
the same as that provided by the program with optimizer abilities. Any
differences that come about is a measurement of deviation from
Maxwell's laws and thus its applicability. There are other programs
that are available that are useable only for

predetermined planar forms such as the Yagi where all forces are not
accounted for
such as the Corriollis effect i.e. that force is ignored thus Maxwells
laws are not applicable.

I should have specified a large, solenoidal loading coil such as Cecil
is so fond of using. Cecil has since eschewed his "degrees of antenna"
position, but, for some reason, he keeps claiming your tests on the
small solenoid were wrong.

There are some other configurations that I personally think are interesting to ponder. You might never actually build one this way, but you'll probably gain some insights considering it: an antenna, say a nominally 1/4 wave vertical for 40 meters made from 4" diameter aluminum tube (irrigation pipe) twenty feet long, resonated with a loading coil placed inside the tube across a gap of two or three inches in the pipe. Capacitance from the coil is almost entirely to the pipe in this case, not to the world outside the pipe, so the effect is capacitance in parallel with the coil, not as in a transmission line where the capacitance is to ground. That's a different situation than one where a coil with a diameter much larger than the antenna conductor is used, where the coil has significant capacitance to the outside world (e.g. to ground).

It's also worth considering that the charge distribution on an antenna is dynamic, so it's probably not a good idea to try to analyze the antenna as if there was the same capacitance to ground from the coil as there would be if the charge distribution on the antenna wire were static (that is, the DC case, or at a frequency that's a tiny fraction of the lowest natural resonance of the antenna system).

Analyzing exactly how even a simple wire antenna works in detail is far from trivial, and when you add in a coil that has significant physical size, it further complicates things. If you use a simplified model, it can be useful to gain insights into what's going on, but don't expect the details to be correct. Be wary about gaining insights that aren't actually true.

Cheers,
Tom

> 73, Cecil, IEEE, OOTC, http://www.w5dxp.com

You are quoting the aproach of the bookswhere it is acknowledged that
radiationn cannot fully be explained
For me I am quoting an alternative that does provide the explanation.
If current moves at the speed of light within the Universe (the
speed of light relative to Earth is slower which creates delay
compared to the former. Insertion of Plank's constant I believe is
a metric that represents the ratio of that delay)
it imparts the same speed to a static particle when impacted, where
the acceleration is determined by Newton's law u.t +f.t sq/2. Since
the particle is static the "u.t" portion equals zero and f.t.sq/2 is
the acceleration from zero to that of the speed of current of the
particle, which is a measure of the expended kinetic energy that
creates the initial format of radiation. I state again without mass
there can be no acceleration.Period

which makes perfect sense...
NEC is a MoM code and is ideally suited to calculating the current
induced in one wire by the currents in other wires. I should think it
would do an excellent job modeling a air core solenoid, especially if
the wire diameter is small compared to the spacing between turns,etc,
assuming that you don't get into numerical precision problems.

NEC does OK at microstrip patches with air dielectric (or foam with very low permittivity). I've used it to model an array of 9 patches and the port to port coupling calculated by NEC and measured by a VNA were pretty close (within measurement uncertainty).

It's pretty darn slow at this, though (lots and lots of wires in each patch), I used lumped loads for the matching network model (capacitive probe feed)

Depends on what your modeling needs are. NEC and it's ilk are more generalized, but take more computational effort. The Corums have an analytical approximation that is reasonably good for a certain class of configurations, although I have to say that for the original Corum application of Tesla Coils, a lumped approximation gets you almost as close, at much less work, considering the usual construction tolerances in a tesla coil. Modern Tesla Coil modeling is typically done with either a lumped model or a FEM code that assumes it's axially symmetric and often an assumed voltage distribution. The assumed distribution the result of a combination of more detailed analytical modeling and some experimental measurements on real coils, and speeds up the computation drastically, while not adversely affecting the accuracy of the results (that is, the changes are less than a few percent, comparable to construction tolerances on these things).

> of modeling antennas?

EZNEC and the Cecil-Corum method are in agreement.
How would you measure the delay through a wire
or through a coil using the following current
reported by EZNEC through a 90 degree monopole?

EZNEC+ ver. 4.0
thin-wire 1/4WL vertical 4/23/2009 8:01:44 PM
--------------- CURRENT DATA ---------------
Frequency = 7.29 MHz
Wire No. 1:
Segment Conn Magnitude (A.) Phase (Deg.)
1 Ground 1 0.00
2 .97651 -0.42
3 .93005 -0.83
4 .86159 -1.19
5 .77258 -1.50
6 .66485 -1.78
7 .54059 -2.04
8 .40213 -2.28
9 .25161 -2.50
10 Open .08883 -2.71

Exactly how does one use a current that changes phase
by 2.71 degrees in 90 degrees of antenna to obtain
the delay through anything?

Your silence on this subject speaks volumes.

Yes, I have fine-tuned my concepts over the past 5 years.
What rational person would not adjust their concepts to
match the technical evidence? (It's a rhetorical question.
We all know who refuses to do that.)

Roy's tests were wrong in the sense that they were meaningless
no matter how accurate the readings. Quoting my web page:

"All of the reported conclusions based on loading coil
measurements using the current on standing-wave antennas
are conceptually flawed."

Well, consistent with that, records seem to indicate there was a big flash of it at one point. And if that was Him, then He is also responsible for all the stars and planets which subsequently coalesced. At which point there began an enormous and complex organic chemistry project which, given the amount of time He's allowed it to work, has now provided almost an infinite variety of results, including the inhabiting of at least (and perhaps only) one of the planets with intelligent life.

There are of course a variety of simplified, abridged, and age (or epoch) appropriate versions of this history, the actual scale of which is only slowing revealing itself to us. So it's apparent that if a creator created all of what is, then He is responsible for a far more intelligent design than the history books give Him the credit for; far too intelligent perhaps for us to comprehend. Or maybe He is the simple minded guy with anger management issues they wrote about hundreds of years prior to sanitation. I don't claim to know.

That may be, but a 24 hour day, i.e. sunrise to
sunrise, was impossible without the sun which was
created on the 4th day.

Actually, The Bible says that 1000 years in the
life of man is like one day to God. So why can't
2 billion years just as easily be like one day to
God?

The sun was indeed created about 8 billion years
after the Big Bang. 8 billion years divided by
"4 days" is indeed 2 billion years.

Tom you are correct in not making a descision on the basis of one observation but consideration of all the observable facts. The analogy of this is only with the use of alln segtments of a jigsaw puzzle can there be confidance of the ensuing picture.
Roy stated that his conclusion was only based on one observable and where his statement said he did not care beyond that single observable which matched a predetermined picture. An accurate production of the ensuing picture comes about only with a matching relationship between all the parts of the jigsaw and certainly not based on the visual of one. Your last sentence speaks volumes regarding Roy;'s responce

Yes, I meant patch antennas with common dielectrics, which are far more common. It's of course the dielectric that NEC can't account for. I've designed quite a few antennas on PCB material, but use a fudge factor based on comparison between measured and EZNEC results of a simple antenna near the same frequency. This gets me pretty close, but even this approach wouldn't be adequate if field coupling through the dielectric is significant.

> It's pretty darn slow at this, though (lots and lots of wires in each

For large models, calculation time goes up as the cube of the number of segments, so big models can get slow all right. However, EZNEC has undergone a pretty dramatic speed improvement over time as various code substitutions and updated compilers have been used, and it's much, much faster than older NEC compilations. And some versions of NEC have been similarly updated, so people using different NEC compilations can experience pretty different calculation speeds.

Well I am following the laws of physics. Since you were asleep during
part of the lecture When the examination comes along you can only
rely on baffle gab rather than ALLthe facts given during the lecture.
Fortunately, one can graduate by providing some incorrect answers up
to a limit where as total attention is the only route to a 100 percent
score. You would be wise to accept that your knowledge on physics is
not totally without error because of the baffle gab that you provided
instead

You are correct in pointing out that a Tesla coil is a lumped
inductance. A "preponderance" of a lumped load disqualifies the use of
Maxwell's statements
The only metrics he supplied to justify the presence of equilibrium
were distributed loads and no more.

If eznec does not take into account dielectric loading then the
application is not in equilibrium and thus Maxwells laws are not
applicable. Maxwells laws are based solely on the presence of
equilibrium or accountability of all loads applied which when all are
added equals zero per Newtons laws.

Exactly. Maxwells law application is solely on the condition of all
forces be accounted for such that the summation is equal zero.
Omission of consideration of a force that is present prevents the
summation from equaling zero which means the creation of an error.
Very simple my dear Watson. This is tantamount to creating an abitrary
border where one omits recording the full amount of flux created.

I didn't do exactly as you say, Tom, but I did take a homemade coil
(140mm long, 155mm in diameter) and wrapped it with a sheet of .005 inch
copper foil separated by a couple of strips of double sided foam tape.
It acted more like a transmission line than the bare coil, but it had
some peculiarities that made its behavior puzzling to say the least.

>
> Owen

Owen you make a very good point by alluding that the zero cross over
point is not 50% of a the time for a full period but 0.67 % of a
period.Thus if a tank circuit is inclusive of a radiation period this
represent a difference in speed or time with respect to charging and
discharging of lumped loads both of which must be included
to achieve equilibrium in the absence of friction (perpetual motion)
Thus the peak
amplitude of the resulting occillation at a particular frequency
determines the characteristic impedance when resonance occurs at that
frequency. In the real world on Earth occillation without friction is
impossible thus frequency losses are in parabolic or additive form
with the change in the number of periods which equates to frequency.
Thus the 0.67 cross over point represents the difference of time
between kinetic and potential energy accomodation which produces a
curve that deviates from a true sinosoidal curve. Since NEC is formed
on the condition that the exchange time between potential and kinetic
exchange are equal i.e sinosoidal then the results obtained have an
inherrent error ie assumtion is different from the factual. ie not
truelly sinosoidal.

> Tom Donaly wrote:
> > Nothing is perfect, but which is better, EZNEC or the Cecil-Corum method
> > of modeling antennas?
>
> EZNEC and the Cecil-Corum method are in agreement.
Correct but the solution is in error as equilibrium demands that the
radiator is in equilibrium ie equal to a period or multiples there of.
Both of the above determined that resonance alone without reference
to the period was a reflection of equilibrium.
This may account for Krauss's error in determiming gain via Maxwells
law by determining a half wave was in equilibrium and thus determined
gain was approx
3db more than that was actually attainable. Later measurements mad by
others show that Kraus over estimated the gain by 100 % the equivalent
of 3db or the doubling of gain or energy expenditure.This error is
actually a reflection of pitch of windings which is a fraction of the
possible generated electric field for maximum efficiency.

Lesson
One must account for all actual vectors used within a boundary for
equilibrium
where the addition of all vectors finish at the starting point of the
period. The idea that a coil does not radiate is fallacious since the
charge is still accelerating but to a lesser extent than when current
moves along a straight wire. The total velocity factor is the average
velocity of that of a slow wave plus the velocity without the addition
of lumped loads ie straight radiator addition.This being equal to the
total length of wire
required with tha absence of lumped loading ie straight.

In graduate school, more years ago than I care to admit, I scrapped a surplus computer for parts. The computer had been custom built for the Savannah River nuclear facility. In addition to the many hundreds of 2N404A germanium transistors, I found the core memory made of ferrite cores about 0.1 inches in diameter and about 30 mils thick. But the most unusual thing, at least to me, was a flexible coaxial cable about six feet long made of a ferrite-loaded rubber core wound with 40 gauge enameled wire, wrapped in a thin cellulose acetate film (Scotch tape?), covered with a braid shield with a vinyl covering. Of course, it was a distributed delay line. I never measured its impedance and delay properties accurately, but the cable had a significant delay that could easily be seen on a 5 MHz bandwidth scope. Even with an approximate termination, the cable's losses were quite high.

This was obviously a commercial cable, but in all of the years since, I have never seen anything like it.

By the way, after dismantling one panel covered with terminal strips, I found a typed note inside that said, "Built by pigmies in darkest Africa."

>Precision is the number of sig figs. You "might" have calculated three,
>rounded up, and reported two.

Precision is NOT accuracy. Resolution is NOT precision. Accuracy is
defined with precision to a resolution.

You can state a value with great precision and be 100% in error.

100 V is quite precise; "about" 100 V is less precise.

100 V has three places of resolution.

If the true value is actually 201.45 V then 100 V is precise, somewhat
resolved, but inaccurate. On the other hand, 201.45 V is very
precise, highly resolved, and accurate to within 0.005 V (if we are to
trust it as a reference) or 25 parts per million.

I can anticipate the objection (to confound my statement above) that
100 V has both resolution and precision. True, but that objection
would miss the point. Some standards are nominal (or cardinal) values
such as an 1 MHz URQ-23 frequency standard: 1 place of resolution, but
highly precise with an accuracy of (from my experience) of 6 parts per
trillion (after calibration against a cesium beam standard).

I can anticipate the fine objection that the nominal value of 1 is
actually 1.00000000000. Again, true, but in a world where you own an
URQ-23 (and no one has access to HP 5071 cesium clocks), then you get
to snub that objection and demand: "It IS exactly 1!"

>>
>> He created light on the first day.
>
> That may be, but a 24 hour day, i.e. sunrise to
> sunrise, was impossible without the sun which was
> created on the 4th day.

Let's review:
Gen 1:1 In the beginning God created the heaven and the earth.
Gen 1:2 And the earth was without form, and void; and darkness
[was] upon the face of the deep. And the Spirit of God moved
upon the face of the waters.
Gen 1:3 And God said, Let there be light: and there was light.
Gen 1:4 And God saw the light, that [it was] good: and God
divided the light from the darkness.
Gen 1:5 And God called the light Day, and the darkness he called
Night. And the evening and the morning were the first day.

Notice in Gen 1:4 that God divided the light from the darkness?
Thus the first day. Without the sun. Don't ask me how.
But, the sun is not the only thing in the universe that creates
light. Nor does it create the only type of light. Fireflys
for instance create a bioluminecense (sp?) type of light.
So the sun is not needed to create light. Nor is the first day
defined in terms of the motion of the sun.

OK, that's a reasonable theory.
We could ask Him when we get the chance.

Now: When God said "Let there be Light", What type
of antenna was he using?

you never have defined equilibrium or shown where it is a requirement on
maxwell's equations. i have stated that maxwell's equations rely on NOT
being in equilibrium since they describe fields and waves that can vary in
time, hence they are not in equilibrium with anything. keep going art,
always fun reading!

The Bible needs to be re-translated in "light" of
the most recent facts.

Gen 1:1 In the beginning God created the Big Bang
which contained the future ingredients of the sun,
the earth, the moon, and everything else that
exists in the universe today.

> Gen 1:3 And God said, Let there be light: and there was light.

And God said, Let the universe expand and cool so that
space becomes transparent and photons can move freely
at the speed of light.

> Now: When God said "Let there be Light", What type
> of antenna was he using?

For the first ~400,000 years after the Big Bang, the
universe was opaque. When the universe became transparent
thus allowing light to propagate freely, it would
be another ~7-8 billion years before the sun and the
earth coalesced from the primal material.

Boundary laws are a part of nature as is mathematics.Every time you
have an equation which uses the equal sign is the mathematical use of
physics.
It allows the movement of all metrics to one side of the equation such
that all metrics used in summation must equal with zero. Maxwell used
this very same fact in determining his laws when he found what he had
derived was NOT equal zero which thus showed it was missing the
metrics of displacement current (deduction) such that all metrics
cancelled out.Again an example of Newtons laws where every action has
a equal and opposite reaction To determine that tha Maxwell is not
using the term Waves is to note that all metrics are nouns in
equations and the term "wave" is an adjective. All elermentary.

Please allow me to correct myself on the above
Equations comprising of nouns only in a static field. A dynamic field
has both
adjectives and nouns via the metric of time However the sum of the
metrics must still
equal zero.

Sorry about that

Here is where we always go wrong. Re-interpreting things based on our own
understanding. This is how the flat-earth people got started. If it don't
make sense, just leave it there as a curiosity until it should make sense
when all is revealed. Lean not on your own understanding.

Ask the Somalian pirates what they think.
Maybe Jeff thought eating his lovers would be a form of evolution. It is a
form of "CHANGE".
Evolution also implies that a species get's better over time. This is
highly debatable.

Screw rhetoric and polemic. We don't even need to put labels on it.
Government power can be divided into that which is moderated by the consent
of the governed, and Government power that isn't. When a Government doesn't
have to worry about getting beheaded or losing an election, it is free to
govern at it's own pleasure.

Just look at the result of it. And no fair re-spinning history. McCarthy
thought it wasn't a very good idea to have Soviet spys in the Army crypto
room after WW2 so he started asking about it and why they shouldn't just

find another job. So rather than denying it, Dems got Hysterically Dramatical and haven't stopped since. Most of them just went on the talk show circuit and got honorary chairs at the universities, so it isn't like they were walking the streets living out of dumpsters. The Venona project finally revealed that most of them were in fact either foreign agents, handlers or helpers of a hostile power.

Tell me you hadn't noticed that the bright future promised to the world by scolding magpies, doesn't exist anywhere they have achieved totalitarian control. When you control by fear, you don't really need the hearts and minds of the people anyway. All they have to do is look and act that way, or else.

As for those who think this is off-topic, then change the subject line to something about antennas.

I will be happy to David
It is balance as referred to by the mathematical equal (=) term where
all metrics can be placed to one side and summed to the value of
zero. In physics it represents the physical laws of Newton and other
where "every action has an equal and opposite reaction" as used in the
time worn uses when establishing a arbitrary border as per Gauss's law
of Statics or Maxwell when determining the absence of metrics deduced
the missing levitational force(displacement current) in his law's or
calculations. All of which were established by observations thru the
years of the Universe with respect to Earth in relative form . (See
Einstein's law of relativity) This can be seen as motivation of the
Grand Universal Theory which Einstein gave up on because of his
failure to identify what is known as the "weak force" which is part of
the standard model of physics. It was Foucault that much, much later
that found or discovered the displacement current which is what I
determine to be the "weak force" and also the required metrics that
Maxwell added to his equations to represent the measure of
equilibrium.
The above explanation is probably longer than what is usually found in
terms of words but I tried to relate to the evolution of physics with
respect to that same word to provide better understanding rather than
describing it in niche terms of mechanical and electrical terms of the
physical Universe
I thought you were getting bored with physics!

While putting my definition down with respect to equilibrium it seems a good time to expand it to why particles and not waves are the subject of Maxwell's laws.
Both Maxwell and Gauss generated arbitrary borders in their summation of the laws of statics and the laws of radiation. The only difference between them is one descibes a static fiels while the other descibes a dynamic field both of which the forces must be summed up to equal zero. It was Maxwell you changed the static field to a dynamic field when he saw that the metric of time was only on one side of the equation which meant that the unlikely discovery of an equation that was not in equilibrium within the boundaries of the environment under consideration. Thus he expanded the law of statics by making it dynamic which required the addition of the metric of time which would cancel out when establishing the presence of equilibrium.
It should now be obvious to all on this group struggling with waves versus particles
that when changing the field to dynamic one must recognise that mass or particles are present in this action and not waves. This provides authenticity of my personal position of the presence of particles in radiation and all laws of our Universe.
Hopefully the above will convince all other members of this group as well as those that deny the presence of the Grand Unification Theory but I will not hold my breath.

No and No. Nor can I read Aramaic, Greek or other languages. Thanks for the illustration.

Language always leaves room for misinterpretation. Even when using simple 5th grade English, many people only grasp certain key words and have difficulty grasping the meaning of complete sentences let alone complete paragraphs, so have trouble communicating in the first place. They fail to interpret the experience of others and are doomed to learn from their own mistakes and be mis-lead. It is interesting to point out though, many different versions of the Bible (other than commentary or paraphrase) by different translation teams do very well at conveying the same thought and it is worth while to do parallel study to have a better understanding of that problem. The imprecision of common usage of the English and other languages also seems to be a limitation, but not so much as you would expect. One of the translation skills comes from reading many other surviving texts and even hostile sources, to get a better picture of language usage and events of the day. It is a good thing to have some patience with people who jump to conclusions even because it is so difficult for all of us. It is certainly even more difficult for those under duress, but without love and courage we are dead already.

Grace and Peace

2511. Dual-Z0 Stubs

I have previously presented my thoughts about the
similarity between dual-Z0 stubs and base-loaded
mobile antennas. Here is an article on the subject
of "Dual-Z0 Stubs" that is directly applicable
to base-loaded mobile antennas.

If we can shorten a stub by using two Z0s, why
can't we shorten an antenna by using two Z0s?

so any equation with an equals sign is in equilibrium?? that applies to
everything then, since all equations contain an equals sign they are all in
equilibrium by definition. my i'm glad you explained that art, i might have
gone through life never knowing that by taking e=ir and rewriting it as
e-ir=0 i have put ohms law in equilibrium and then all is well with the
universe! so the conversion of mass to energy in the famous equation e=mc^2
is really in equilibrium as e-mc^2=0, so no mass is converted to energy or
vice versa! wow, what a revelation! thanks again art!

Congratulations, Cecil, you've just re-invented the electrical analog of the Helmholtz resonator. Your analysis would be a lot simpler if you'd first characterized each stub with T parameters and then multiplied them together to get a two port you could use to find the conditions for the resonance of the entire stub. You could then use the differential calculus to find out what the criteria was for the shortest overall stub. (It's true, both lengths have to be the same.) If you want to take a stab at using your discovery to deal with antennas, why don't you use two "dual Z0 stubs together to make a folded dipole. You could even do that in EZNEC. Applying this to your favorite loaded dipole is a stretch, but that probably won't stop you from trying.
73,
Tom Donaly, KA6RUH

(P.S. Where did you learn about "dual Z0" stubs?)

Art wrote:
"I thought you were getting bored with physics!"

We must live with physics, bored or not. The parabola is well understood. its use as a reflector is documented by Kraus and the "ARRL Antenna Book". A good description is seen in "Principles of Radar" published by the MIT Radar School Staff in 1946. On page 9-78:

"The geometrical properties of parabolas are important for demonstrating the existence of a constant-phase surface. First, a parabola is by definition the focus of points as far from a fixed point called the focus as from a fixed line called the directrix. With reference to Fig. 51A, this means that lengths AA` and AF are equal, BB`and BF are equal, and so on. Second, a line drawn tangent to a parabola at any point (as in Fig. 51B) makes equal angles with a line drawn from this point back to the focus and a line from this point parallel to the axis of the parabola. When a point source is placed at the focus, it sends out energy in a single time phase, but in various directions. This energy strikes the paraboloid at points such as A, B, and C, (in Fig.51A), and is reflected in a direction parallel with the axis because of the second property mentioned. The first property predicts that the phase change that the wave undergoes in traveling to points A``, B``, and C`` on the surface SS` is the same for each ray, the phase change being equal to the distance in electrical degrees, from the diretrix to the surface SS` plus 180 degrees, due to the phase reversal upon reflection. Thus the field reflected from the parabola has a single time phase in a plane across the mouth of the parabola. The field radiated forward by the point source tends to upset this constant-phase surface, but this effect is usually minimized through the use of sources which radiate appreciably only roward the reflector.

Best regards, Richard Harrison, KB5WZI

>
> Do you think this might have been a Distortionless Line?

With the limited bandwidth of the scope, it looked like there was little
distortion. I could see no overshoot or ringing like that seen with
conventional artificial delay lines, but I suspect that
the junky scope was the reason.

In early radars, liquid-filled tubes with acoustic sensors on each end
were used to produce time delays. Typically mercury or water, being
incompressible, were used to fill the tubing. I have seen commercial
delay lines made from quartz rods too. The rods were generally quite
small in diameter but were very long and wound into a spiral. Of course
then there were audio "reverbs" that used springs stretched between
transducers.

Back when I was doing lots of analog computer work simulating automatic
control systems, I used Pad&#65533; approximations to simulate pure time delay.
Since we are getting rather far away from antennas and transmission
lines, I will give references rather than discuss this here.

Tom,

How would that work in a folded dipole? Surely it's not the
differential mode "stub" you're trying to shorten - it's the common-
mode radiator.

Owen,

I simply pasted and copied your formulas in my Excel.

For f=144:

- the first formula gives me 0.00108893 that is 0.108%, which is 10 times lower than your figure
- the second formula gives me 3.41851e-08 that is 0.0000034%, which is 10,000 times lower than your figure

I did that three times, same results.....

I cannot understand what can be wrong....

Hi Steve,
I have no idea what Cecil will find if he tries his
theory on this. However, according to Cecil's favorite text, a
folded dipole's behavior can be analyzed by assuming that its
current "is decomposed into two distinct modes: a transmission
line mode and an antenna mode." (From Balanis, _Antenna Theory_)
You've got EZNEC; you can try this, too. It won't cost you anything,
and, if nothing else, you might get the satisfaction of telling me
how wrong I am.

Tom: I was unaware of "Cecil's favourite text" and did my own work on the folded dipole some time ago:
http://www.karinya.net/g3txq/folded_dipole/

I too found that you can resolve the currents between the two wires into a common-mode radiating component and a differential-mode stub component. My particular interest was in situations where the velocity factors of the two modes is very different - for example if you use zip cord for the construction - and discovering where you then need to place the stub shorting links for minimum effect on the feedpoint impedance.

I was disappointed to see that recent editions of the ARRL Antenna Book don't recognise this effect, but earlier editions do. I have also found that Cebik's analysis of the topic is incomplete, as a result of which he reaches the wrong conclusion about shorting link position. I wrote to ARRL about it some time ago, suggesting they re-instate the original text, but they seem disinclined to respond.

Without modelling it, my guess is that a ""dual Zo" approach will require the shorting links to be placed much closer to the centre of the antenna, but it will do nothing for the overall length required for common-mode resonance. After all, what you require of the stubs is that they be very high impedance across the feedpoint, and with "dual Zo" that would require them to be much shorter.

Now, if you can think of some way of forming a large discontinuity in the COMMON-MODE Zo we may be onto a "breakthrough" ;)

While I was figuring out why Roy's "measurements"
were very accurate but virtually meaningless.

In an ideal stub, the current doesn't change phase
from end to end. An antenna is more like an ideal
stub than most people realize.

Well, we all like Distortionless Lines, almost all ham discussion and indeed much if not most textbook discussion is about one special case of a Distortionless Line, the Lossless Line.

Nevertheless, we apply one property of Distortionless Lines to real lines, the property that Zo=Ro+j0, and that Zo is independent of frequency.

But, a real Distortionless Line (real excludes Lossless) doesn't have much application for us.

Though I haven't had my hands on a Distortionless Line, it occurs to me that increasing L/m is a means of diminishing the effect of changing R/m, making G/m higher is another means of making Zo real, and if the materials make R/m(f) track G/m(f) closely ... then the problem is mostly solved.

Owen

This is, of course, referring to Roy's "measurements"
of the "delay" through a 75m mobile loading coil as
being close to zero since there was "no measurable phase
shift" - as if the phase shift had anything to do with
the delay in a standing wave antenna. Hint: It doesn't!

Any person with a modicum of mathematics skill can
look at the following equation and know that there
is no phase shift relative to x in 1/4WL of wire or
coil.

Itot = Imax*cos(kx)*cos(wt)

Since Roy has known these details for more than
five years, I can only assume that he knows that
he is wrong but refuses to admit it - hoping that
his guru status will continue to promote his
old wives' tale.

Well not exactly. The innards of the arbitary boundary must be in a
state of equilibrium
thus when making the arbitrary field a dynamic field by adding time or
such things as radiators the innards must stay in equilibrium. Thus if
radiators are added they also must be in equilibrium which requires
all to be approximately one WL or the equivalent of one or more
periods of the frequency in use. Thus the majoritory of added
radiators may be the one of choice in terms of feed point

ok, if a one wl radiator is in equilibrium, give me the equation describing
the current and radiation pattern from that radiator in free space.

David you are fishing for info for your next phase of attack. Soon I
will get right on it and work thru day and night and all weekends per
your request of me so please do not arrest me if I do not fullfill all
of your expectations of me. I have asked my wife to delay her birthday
because obviously your demands of me with respect to antennas or
equilibrium comes first. I would remind you that I did supply
dimensions of a tipped radiator in equilibrium some time ago on this
newsgroup but you showed zero interest. What has changed?
Your devoted servant
Art

>Your devoted servant

tipping a radiator is an obvious exploit of changes in pattern by
unbalancing the ground current. it gives some gain in one direction at the
expense of other directions. it is not all that useful unless you want a
tipsy looking antenna and are covering a fixed direction... unless you made
an array of tipsy verticals for vhf and rotated them... that might be fun.
besides i had enough bent elements from the winter ice, they didn't improve
the yagi performance. so i've had enough of that. but 'equilibrium' as
defined by art is a magic jewel to be examined.

i do take exception with 'dave' though, the equation should be Xl=-Xc or
Xl+Xc=0 to put it in art's form.

Not terribly well. "Short" antennas (significantly less than 1/2
wavelength) have a very reactive impedance, and don't couple
efficiently to the E/M wave.

It may work well enough for your area (depending on the VHF signal
strength) or maybe not.

>2) I have not trimmed or dressed the twin lead from the bowties.
> I understand that twin-lead can act as antennas.

Yup. Sometimes a problem, sometimes not.

Sensitivity of twinlead to external fields can be reduced by twisting
the twinlead (one rotation every six inches or every foot is a decent
starting point) and by keeping it a few inches away from anything
metal. Use insulating standoffs to run it down the antenna mast.

Or, convert from the twinlead to a 75-ohm coax (e.g. RG-8) using a
balun, and run coax down to your TV.

> So what
>is the best way to manage the twinlead? Cut it back? I noticed
>that when i laid the leads together, in an attempt to make a
>neat assembly, I got signal cancelation.

Trim it back to a reasonable minimum length, don't loop it back along
itself or run it next to itself (or other twinlead, or anything
metal), and twist it periodically.

>4) Any suggestions for alternitive DIY designs?

You may want to consider adding a "folded dipole" in parallel with the
bowtie arrangement, with the dipole being cut to the wavelength of the
lowest-frequency VHF channel you'll want to receive.

If you need more gain or directivity on VHF than a dipole will give
you, then using a log-periodic antenna (the classic rooftop VHF/UHF
type) may be your best bet. These *can* be home-brewed but they're
more complex than a simple bowtie-and-reflector.

Source record: 16014

This seems to be the only news group devoted to the topic of antennas.
(and the origins of the universe). So maybe you guys can help me
with this.

I have been experimenting with fabricating a decent
indoor DTV antenna. I have tried several things. What I have
now is two bowties spaced about 7 inches apart on a wood dowel.
A peanut butter jar with rocks in it makes up the base.

It seems to give pretty good performance. It could be better.
But I am wondering about a few things.

1) Right now all the digital transmissions are in the UHF band.
but in 6 weeks, three stations will move back to their VHF
assignments in the VHF high band.
How well can I expect my antenna to work in that frequency band?

2) I have not trimmed or dressed the twin lead from the bowties.
I understand that twin-lead can act as antennas. So what
is the best way to manage the twinlead? Cut it back? I noticed
that when i laid the leads together, in an attempt to make a
neat assembly, I got signal cancelation.

3) Any suggestions to improve this design?

4) Any suggestions for alternitive DIY designs?

Thanks

> of frequency.

Or, in other words, the Heaviside Condition is met.

C/G = L/R

This is met in lossless lines with R and G being zero, and the
characteristic
impedance being real.

_____ _____
Zo = v((R + j?L)/(G + j?C)) = v(L/C)

> But, a real Distortionless Line (real excludes Lossless) doesn't
> have much application for us.

Consider that with real inductors and capacitors, the permeability,
�, and the permittivity, e, are themselves often complex.

� = �' + j�" and e = e' + je"

Of the two, I am most familiar with dielectric properties of
polymers as a function of frequency. With plastics like
polyethylene and polytetrafluoroethylene, e' (the real part) remains
fairly constant from low frequencies well into the microwave region,
and e" (the imaginary part) is quite low. Plastics like
polyvinylchloride, on the other hand, show an increasing e" with
frequency due to rotational hindrances of strong dipoles in the
polymer.

Similar frequency dependencies are seen at optical frequencies,
where the refractive index is a function of wavelength. Chromatic
aberration, the failure of a lens to focus all colors to the same
point, is caused by this change of refractive index with
wavelength. In general, the refractive index of a material
increases with increasing frequency. In the infrared and visible
portions of the spectra, we see large changes in permittivity
because of vibrational resonances in the polymer groups.

> Though I haven't had my hands on a Distortionless Line, it occurs

> then the problem is mostly solved.

With typical commercial coaxial cables, the ratio of shunt conductance to shunt capacitance is generally much lower than the ratio of series resistance to series inductance (all per unit length). This makes the characteristic impedance complex, and the cable causes distortion.

In the weird cable I described earlier, the resistance of the wire would increase linearly with the number of turns per unit length but the inductance would increase as the square of the turns per unit length. So there would be merit here. Increasing the shunt conductance will also help at the expense of making the cable extremely lossy.

While we have been talking about conventional electrical transmission lines, we can also analyze nerves as a transmission line. A nerve is essentially an electrical transmission line with chemical transducers on each end. When a receptor synapse detects a neurotransmitter, like serotonin or norepinephrin, it sends an electrical signal down the neuron. The neuron is the transmission line. It is essentially an ionic conductor covered with a fatty substance known as myelin. The result is a distributed resistance-capacitance line. In diabetics, the myelin sheath is partially destroyed and replaced with sorbitol, a sugar alcohol. In addition to being more conductive than myelin, sorbitol has a far higher dielectric constant. Viewing the neuron as a distributed RC line, we have both added shunt conductance and increased the capacitance. It is no wonder that nerve conduction velocity and amplitude both decrease resulting in such things as peripheral neuropathy, usually associated with diabetics.

I contracted a disease when I was young, a disease that caused the body's T cells to attack the cells of the mylon sheath (in our terms, the dielectric that separates the =ve and -ve ionic material in the nerve's coaxial cable, effectively shorting the coax.

During a week or two of onset of the disease, the doctors performed TDR like tests on nerves in my legs, placing a pair if needles each side of a motor nerve, at each end of the nerve, and pulsing the nerve from a signal generator. The sig gen fired a CRO with a camera and 100' roll film back. They took thousands of pics over the couple of weeks, measuring attenuation and velocity of propagation.

Yes, I am aware that there are parallels.

Owen

Don't worry, Owen. Most of the time, I put two "l's" in the word myself!

> I remember things I see, and at that time I couldn't focus on
> things, never saw the word written, was paralyzed and was
> distressed at drowning in my own secretions because I couldn't
> swallow and couldn't cough.

About two years ago I developed phlebitis. I went to the doctor who had Doppler ultrasound tests run. He told me that my circulation was good and that the swelling in the left leg would clear up by itself within a week. But one of my toes swelled up and cracked open. Being a diabetic, I immediately returned to the physician. He told me that I had just enough time to drop by my home and pick up some clean underwear to take with me to the hospital. When I got to the emergency room, admission papers were waiting. I had no idea that septicemia could set in so fast.

They amputated two toes, then another, and finally my entire left foot. Meanwhile I had continuous IV injections of some of the world's strongest antibiotics. I lost weight too - from 215 to 155 pounds. Small clumps of dead blood cells were sloughing off my heart valves and one blocked a tiny capillary in my brain causing expressive aphasia. It only lasted about three days, but I will forever empathize with stroke victims. I could do complex math in my head, but I could not speak a complete sentence. Fortunately I started recovering soon after the foot was taken.

I am posting this history here as a warning to other diabetics. My HgA1c had been running less than 5.5; most diabetics are considered to have good control if this number is below 7. My point is that even with good glucose control, problems can still develop.

I too have had nerve conduction studies. As you said, they stick little electrodes in your muscles and nerve bundles, only now they have fancy microprocessor-controlled machines to do the tests. But the tests are just as painful!

The worst thing I remember was the neurologist bragging to his nurse, telling her,"Now if I turn this knob, I can make his big toe

rotate counter-clockwise."

Thanks for an interesting discussion, Owen.

Because then he would have had to explain himself.

Have you actually read the anguish of Moses trying to keep those people together just so they could have a future? Clearly God stimulates their anticipation of the future but doesn't give any more detail than what is necessary. Clearly more information is given than what they understand until the event comes to pass. It becomes clear (although some seem to embellish) that God intends to lead them forward with His complete timeline knowledge.

If you search for "diy hdtv antenna" or "diy dtv antenna" you will
come up with other ideas. Someone posted a question a while back here
about a design that apparently is pretty forgiving and not too hard to
construct and is claimed to give decent gain; see
http://www.digitalhome.ca/ota/superantenna/.

Dave P's comments are good, though RG-8 is 50 ohm, not 75 ohm. Good
RG-6 type cable should work well for at least short runs, and it is
nominally 75 ohms. I don't know about your TV (or converter box), but
pretty much all the ones I've seen that receive digital TV broadcasts
have 75 ohm F connector inputs anyway, so you may as well go straight
to RG-6 at the source (the antenna).

Cheers,
Tom

Hi Gordon,

This is a goal in conflict if we are to take it at face value. For one, DTV has design demands that call for widebandedness. This, and the combination for VHF coverage combine to drive the design to being large. This is typically the domain of outdoor antennas, and for good reason (large for DTV is going to be honestly large).

This is a simple matter of scaling. If the frequency shift is by an order of, say, 2:1; then the size will increase by an order of 1:2. Frequency and size are in an inverse relationship. Try doubling the size of your current design, and looking for a gallon size peanut butter jar.

>2) I have not trimmed or dressed the twin lead from the bowties.
> I understand that twin-lead can act as antennas. So what

>neat assembly, I got signal cancelation.

This is an indoor antenna. It is going to suffer from any number of things in proximity and your attempts to dress the leads probably were not responsible for the signal quality change you observed. I will bet that attempt to make a neat assembly had a lot of re-arranging going on in addition to the lead dressing.

>3) Any suggestions to improve this design?
>
>4) Any suggestions for alternitive DIY designs?

Wait until you have a problem before you try solutions. As I said above, your goal is in conflict with interior available dimensions. The truth of the matter is that a simple rabbit ears antenna might do just as well as the best of the DIY designs littering pages across the WWW.

I know. I'm trying to find a good compromise. But it may not
exist. Unfortunatly, I can't mount an outdoor antenna. I rent,
and the landlord won't alow it.

I've done the math. Channel 2 has a wavelength of about 18 feet and
channel 50 is about 1.4 feet. More than a 2:1 ratio. I do catch a
break since the VHF lo band is going to be vacated in this area. So
channel 8 is the lowest frequency I need to worry about (wavelength
of approx 5.5 feet).

Actually, I tried to keep the situation as controlled as possible.
I initially had the leads just drapped down the "mast" (dowel) to
a balun. It was my wife that tried to improve the asthetics by
neatening up the twinleads. Then she complained that reception
was bad. That's when I was experimenting with the dressing of
the leads. Right now I have it "dressed ugly", but it works.

No, the rabbit ears didn't work very well at all. That's why I have been
experimenting. I have seen a lot of the DIY designs littering the
WWW. This dual bowtie design is mine, tho.

Hi Gordon,

Yes, you've got the minimum specifications there. The widest part of your antenna, at an optimum, would be something under 3 feet (half the channel 8 wavelength) - still pretty big for indoors, especially if the stations are in an awkward angle.

And speaking of stationS (accent on the plural), your design requirements are going to be complex if they are not all on the same axis/direction. And speaking further of stationS, you will need to cover a broad range of frequencies.

The usual, optimal design is called a Log Periodic Dipole Array (or variants of Log _____). It would qualify for being both widebanded enough for one, or many, adjacent channels (growing in length and element count for additional channels). This is why I described the optimal antenna as being "honestly" big.

Smaller antennas are not going to deliver performance - but, again, you may not need optimum, nor performance when the time comes. The bow tie you've described elsewhere seems a suitable compromise.

>Actually, I tried to keep the situation as controlled as possible.

Twinlead is fairly robust "except" when it is in close (three widths) to metal or an RF absorber. As marginal as your situation sounds, my bets are still with clutter near the antenna which is MORE prone to disturbance than the line is.

When the band shift comes, rabbit ears could work quite well. Don't take the plunge into elaborate designs until you have some basis of comparison is all I am suggesting.

I have done that. In fact I have seen plenty of designs: Yagis,
The Coathanger antenna, etc. I have printed up the design of the
Grey-Hoverman. I could even build up a copy of the pVC design
and place it against the house, outside.
We actually had the Radio Shack model that is mentioned
on that site. my dad had it in the pre-CATV days. When I began to
set up the DTV reciever, I asked my dad about the old antenna, but
he didn't know what became of it.

I'm not sure what type of RG I am using. I should point out that I
have the twinleads running down the dowel to a balun. From there,
about 3 to 4 feet of coax runs to the converter box. I could just
put the converter closer to the antenna and slip the balun right
onto the converter.

Art seems to think that getting a patent validates an idea. In fact
devices/ideas that claim to violate known laws of physics are easiest
to patent as they will have little to no conflict with other patents.

The OTARD rule (to which you're referring) allows installation of an over-the-air TV antenna, but it only applies if the antenna is installed in an area which is exclusively for the tenant's use.

People who rent houses are usually able to take advantage of it. Apartment dwellers often can't, because they aren't renting the whole building and thus don't have "exclusive use" rights to the roof or exterior.

I would start with sticking a screwdriver in the TV antenna socket.

While a properly designed and constructed DTV antenna, mounted in the
right place, will undoubtedly work well, some of the homebrew designs
you find on the internet are probably even less efficient than a
screwdriver.

But if you have a terrace or a porch, you may install a receiving
antenna for broadcast or satellite on that porch.

I have seen some very clever antennas on the internet. More clever than
the BS this newsgroup is top-heavy with.

Helmut
I do not know if the rear signals were as you suspected.,
It is extremely windy here in the midwest for the last few days
so I took off the new dish of it's ground stand and placed the dish in
a corner outside the house with a TOA that I assume is about 10-15
degrees. Again I got rear signals
but I noticed the coverage was very narrow and maybe more than one.
So next two weeks or so I will repeat the test but also play around
with the elevation
to see if there are other observables to determine if you are correct.
I am playing with circular polarisation which is a new experience for
me and I believe that is capable of picking up reflections that one
does not normally see with planar designs
Best regards
Art

>indoor DTV antenna.

Please define "decent". You know, the numbers.
How big? (max allowed length, width, height)
How much bandwidth (VHF, UHF, or both?)
Minimum (average) gain?
Mounting limitations?
Omni or directional? Rotator?

I'm also partial to NEC2 models of creative designs. They often show
problems that are not obvious until after the antenna is built. If
you're going to design your own, spend the time building a model.

>I have tried several things.

You seem to have done your homework. Also see:
<http://www.hdtvprimer.com/ANTENNAS/comparing.html>
Some are indoor antennas, which should give you a clue as to what to
expect.

Dunno. I haven't seen any dimensions. Plug the current design into
an NEC model and see what comes out at VHF frequencies. My guess is
that it will be worse than hideous. You would do better with

adjustable rabbit ears.

>2) I have not trimmed or dressed the twin lead from the bowties.

>neat assembly, I got signal cancelation.

Lose the twin lead. The problem with balance line is that any mechanical imbalance (i.e. proximity to walls, objects, people, etc) will unbalance the line, causing some radiation. Such radiation shows up as loss, something you can barely tolerate with such a minimal antenna. If your design is setup for a 300 ohm match, install a balun and run 75 ohm RG-6/u coax instead.

>3) Any suggestions to improve this design?

Improve how? More gain? More bandwidth? Smaller? Numbers please.

>4) Any suggestions for alternitive DIY designs?

Yes, but you may find them rather unconventional.

I once built a log periodic antenna on a sheet of plywood, using #14 AWG house wire and two parallel wires for the transmission line. Elements were arranged on both sides of the plywood and secured with a staple gun. This was for a ladyfriend, who was stuck with severe limitations on outside antenna installations. I hung it from the ceiling, which was the only place suitable for the monstrosity. 4-6dBi gain from 60 to 800MHz (no channel 2). Where were a few ghosts, but it worked much better than the rabbit ears and UHF loop it replaced. However, it only lasted about a month. The landlord found out and demanded its removal while muttering something about attracting flying saucers and alien visitors. Oh well.

Another TV antenna I built took advantage of the chicken wire buried under the stucco outside of the house. The chicken wire acted as the antenna reflector, which was conveniently arranged in the right direction. The driven elements were 4ea phased bow-tie dipoles, hidden behind a decorative wood grating. It didn't work as well as I predicted, but good enough to get decent OTA TV reception.

If you have a suitable window facing the right direction, you can do something with aluminum foil tape. I use aluminum duct tape cut down to size for this purpose. For electrical connections, copper stained glass tape soldered to the coax cable. Any antenna with horizontal polarization will work. You won't get much gain, but the outside window location will somewhat compensate for the lack of gain by offering a less cluttered line of sight to the TV xmitter.

Anyway, use your imagination, but also run the numbers and do a model.

It's considerably more subtle than that, since there are large
commercial interests at play (unlike for ham antennas)..

Go to the FCC OTARD page and get the real scoop.
http://www.fcc.gov/mb/facts/otard.html

As a practical matter, the courts/adminstrative law judges have held
that the landlord's control does not cover, for instance, the air space
outside your window, so if you can mount the antenna within the window's
dimensions(either inside or outside), you're good to go. It is ok for
the landlord to prohibit, say, attaching to the wall outside, though.
Whether the window frame itself is "under your control" is another question.

2570. NEC2 - Correcting for element taper on a loaded element?

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-27 19:05:37 UTC
From: Scott M <mcclements@gmail.com>

Hi All,

I tried this post on the towertalk reflector. I should have tried it first as I find more of you NEC guy hang out here (why is that anyway!??!?).

I was modeling a Cushcraft 402CD loaded 40m yagi. I use Nec-Win Plus and MultiNEC. I enabled stepped diameter correction in both programs and noticed that in both programs a taper correction didn't occur. The output from NEC-Win Plus during the taper correction seemed unhappy because the element resonated around 11Mhz, but the simulation frequency range was 7 Mhz.

How can I calculate a taper correction for a loaded element?

Hi Scott,

It sounds like you have more problems than taper if your 40M antenna
is resonating at 11 MHz. The clue appears to be in the word "loaded
element."

This would surprise me if it did. Tapering involves the segments of
one wire being converted into wires of diminishing length.

Hi Scott,

I went back to your original posting after pondering how your
question:
>How can I calculate a taper correction for a loaded element?
wanders through several topics - such as above.

Taper and stepped diameter are not the same thing, although
tangentially related and asking for "how to calculate" jumps the
tracks entirely.

How about stripping out the extraneous details and simply describing
what your problem is?

"Tapering" is used to mean two different things. One is segment length tapering, as Richard describes. It was essential in MININEC-based programs to get accurate results from wires connecting at an angle, and it's only occasionally useful with NEC based programs in other situations. EZNEC has an automated segment length tapering feature left over from its MININEC-based predecessor ELNEC. More detail can be found in the EZNEC manual index under "Segment Length Tapering". The demo version includes the full manual, and this feature.

The other meaning of "tapering", which is what the thread is about, is diameter tapering, exemplified by a Yagi element made from telescoping tubing. This tapering has a very significant effect on element length. NEC-2 produces a small error whenever wires of different diameter are connected, and this error is enough to seriously affect the pattern of a Yagi made with diameter-tapered elements. An element of a single diameter can be substituted which gives the same result as the diameter-tapered element, but the method isn't intuitively obvious. The length of the equivalent is different from the original, and the diameter isn't an average of the diameters. The method was developed by Dave Leeson W6QHS and described in his book "Physical Design of Yagi Antennas" (ARRL). EZNEC and some other NEC-2 based programs incorporate Leeson's method and automatically make the substitution when appropriate. The method assumes a sinusoidal current distribution, so EZNEC won't make the substitution if the element contains traps or loading coils, or for other reasons isn't close to natural resonance.

But EZNEC also has a method of showing the user whether the substitution is being made, what the substituted wire length and diameter are, and if it's not being made, the reason why. More information is in the EZNEC manual, indexed under "Stepped Diameter Correction".

It sounds like the OP's program normally does a similar substitution but doesn't tell the user the reason when it doesn't. The software developer should be able to explain the conditions under which the substitution is applied.

I am about to refurbish an old Hy-Gain TH3-Mk3 Thunderbird tri-band yagi. This yagi has been used in a coastal environment and thus the aluminum is slightly pitted and most of the connecting hardware needs replacing.

I figure steel wool would work fine for the aluminum tubing, I know how to test the traps, but I am wondering whether to use stainless steel or galvanized hardware? Which would react least over time with the aluminum? Also, I remember many years ago there is an electrical joint compound stuff for using between the tubing sleeves - can anyone please give me some brand names of this stuff?

Any other ideas appreciated....

Larry,

I use "Ox-Gard", available from the local "Do-It Center" hardware store outlet. Preserves overlap joints on aluminum tubing and makes them easy to adjust and disassemble after years outdoors.

Works fine for radio waves, but does not conduct DC. Found this out the hard way in an application where I was passing RF alongside some DC signaling information. The RF got through just fine, the DC not so much.

I would stay away from the steel wool. Bits of it will imbed in the Al
and rust.

Avoid steel wool. Inevitably, it will leave little iron/steel fibers
behind, which will rust/corrode/react with the aluminum.

Use synthetic scrubbies (3M ScotchBrite) instead.

I just called Bencher/Butternut about my aluminun vertical and they
suggested NOT using steel wool for cleaning because the residue
of the steel wool rusts very easily. I know this is true from my boat
where we generally use bronze wool to avoid rust. The steel wool sheds
(and I know this from hard experience) as a bear to clean out of
stuff, such as the deck of my boat. The Butternut guy suggest that
rather than steel wool use either emery paper or a Scotchbright pad as
they do not leave residue. Butternut also has a conductive grease that
they provide with their antennas to keep the metal to metal joints
conductive. Steel wool residue can also cause bimetalic corrosion with
aluminum.

Most assuredly use stainless steel fitting and screws. Ordinary
screws/nuts will rust very rabidly. Any boat owner knows that
many so-called compression clamps, allegedly in stainless, do not have
stainless bolts to tighten them. Most of us take a magnet to the
boating store to ensure we got the right things. BTW a boating store
is generally a pretty good place to get stainless steel hardware. They
know that a boat owner will scream bloody murder and besmirch their
reputation if they sell anything but the top quality stuff. We ran one
boating store out of town for selling shoddy stuff.

I'm embarking on exactly the same rebuild on my Butternut vertical so
I just talked to the factory specialist on this very subject just last
week. My spare parts just arrived yesterday. I'm rebuilding because
after 25 years, the wind flexed the tube that mount the antenna, a

vertical, into the ground. I guess that is not too bad service for this antenna.

If you brush aluminium with a material, there is a tendency for the material to become embedded in the surface.

Stainless steel is widely used to brush aluminium clean before welding, and with minimum degradation. I would not use steel wool. Non metallic scrubbers may embed non-conductive material in the surface, frustrating low resistance connection between clamped surfaces.

I have found the little Dremel #530 stainless wheel brush handy for scratch cleaning the inside of mating tubes, although limited in reach. I haven't tried, but the flexible shaft adapter might give good reach into larger diameter tubes. For the outside, I just use a stainless scratch brush.

> I figure steel wool would work fine for the aluminum tubing,

I've read that it is *not* a good idea to use steel wool to clean up aluminum, especially if it's going to be exposed to the weather. There's a tendency for tiny bits of the steel to get caught in the aluminum... it'll rust.

I'd suggest using a 3M (or generic equivalent) green abrasive scrubbing pad. These pads are rough enough to remove oxidation from copper PC board material, so I imagine they'll shine up aluminum just as well, but they won't leave rustable material behind.

> I know
> how to test the traps, but I am wondering whether to use stainless
> steel or galvanized hardware?

I believe that you can get some amount of electrolysis if galvanized metal and aluminum are in contact, especially if the aluminum is not well-anodized or if there is electrolyte around (e.g. if your area is subject to salt spray). Some people in the boating trade claim "no problem", others state that you should never use zinc-galvanized and aluminum together.

Stainless-steel-and-aluminum seems to be the preferred combination.

3M pads and Bon Ami cleaner works well.

And clean aluminum has better gain. One of my 432 antennas tested at
Central States gained .4dB between very dirty oxidized elements and
cleaned elements.

Neverdull is far better to use.

When I refurbished my TH-66DX about 10 years ago I used the green
"synthetic" steel wool or scotchbrite material.
Worked great and no residue left over.
Between the elements when put back together I used "never seize". Worked
well and conducts RF and DC.
After ten years I have not had any changes in the performance or SWR on the
antenna.

Sort of. At least that's the right configuration.
What I did was to go out and buy a pair of bowties
from Radio Shack. Then I got a dowel at Ace Hardware.
I clipped the bowties 7" apart (measured on center).
to the dowel. The bowties came with about 12" or so
of twin-lead attached. I ran these to a balun and
then through a short length of coax to the DTV converter.
I don't have a reflector, but one could be used to
improve directionality.

>>indoor DTV antenna.
>
> Please define "decent". You know, the numbers.

Decent is subjective. When I first hooked up the
converter box I used the rabbit ears. They didn't
work worth a darn. Signal strength (according to
the OSD indicator) was 40 at best. THe picture
and sound were constantly breaking up. I then hooked
up a bowtie and got better reception, but only barely.
That's when i got the idea for the double bowtie. Now
my worst signal strength is 40 and my best is 75.
Still could use some improvement, but picture quality
is good.

> How big? (max allowed length, width, height)

That's the thing. I don't have room for a ginormus
antenna.

> How much bandwidth (VHF, UHF, or both?)

Right now, UHF 27 to 48.
After the change over, add VHF 8, 10, and 12.

> Minimum (average) gain?
> Mounting limitations?

Prefer indoor not outdoor. A high ceiling makes that
mounting arangement unusable. Although I could hang
a flat antenna on the wall around the corner from the
TV.

> Omni or directional? Rotator?

All the stations are located within a 7 degree cluster, due
east from my location. Directional is good. No rotor needed.

There may well be. But my landlord has shown an
active disregard for any such landlord/tennent laws
and there may also be neighborhood CC&R's.

I did find plans on the internet for a huge dual
Hoverman design. A terrible overkill for my
purposes. But, I could lean such a thing against
a wall outside of where the TV is located.

Boy, the partial truths have been flying hot and heavy here. Allow me to try to explain what is right and what is wrong...

You do _NOT_ want to use steel wool. Aluminum is anodic with respect to steel. When you use steel wool, you imbed steel fibers in the aluminum as many have noted. But what happens next is where most posters are wrong. The aluminum around the steel fiber corrodes protecting the steel from rusting. Thus your problem becomes worse. Eventually the aluminum corrodes enough that it no longer makes good electrical contact to the steel and the steel will rust or else fall out of the pit in the aluminum. You are left with highly pitted aluminum.

I would suggest emery cloth, sandpaper, or a Scotchbright pad to polish the aluminum. I would avoid stainless steel brushes too as most grades of stainless are even more cathodic than steel with respect the aluminum. Likewise avoid brass or copper brushes too. For large areas, sand blasting works well if you use a fine sand and not too much pressure.

As to hardware, I suggest hot-dipped galvanized bolts and nuts. Zinc is slightly more anodic than aluminum, so neither material will corrode much when in contact with each other. Hardware with a heavy cadmium plating is also suitable, but due to the toxicity of cadmium it is a little harder to find. Zinc-plated hardware offers minimal

protection because the zinc coating is so thin. If the hardware is used in an application where minimal strength is needed, consider aluminum hardware itself.

There are many joint compounds on the market for joining aluminum to aluminum. Noalox and Penetrox are two common brands. These compounds are typically a petroleum grease containing zinc particles. These particles are usually produced by spraying molten zinc and air through a nozzle. This produces small, irregular particles whose sharp edges pierce the aluminum oxide surface film when the aluminum pieces are tightly clamped together. This produces a good electrical contact, and the zinc is very compatible with the aluminum from a corrosion standpoint.

Whatever you do, avoid any contact of copper with the aluminum. Where the transmission line connects, be sure and heavily coat any copper solder lugs with solder. Try to keep a hot-dipped galvanized washer between the lug and the aluminum.

Send me an email and I can send you some good articles on corrosion that you might find interesting and informative. My experience comes from many years working in the chemical industry. Even so, I found the plant metallurgist to be a vital resource in material selection for the instrumentation I designed.

> Noting the linear variables and constants in there, and the absence of
> anything that would change abruptly at certain particular values of x,
> what would the expression for a standing wave on a shortened coil loaded
> 90 degree monopole have to look like?

Ideally, it would be of the form:

For x = 0 to top of coil,
Itot = k1*cos(k2*x)cos(wt)

For x = bottom of stinger to top of stinger,
Itot = k3*cos(k4*x)*cos(wt)

where k1-k4 are constants

Note: The above is a conceptual simplification as it
ignores the current "bulge" in a real-world loading
coil.

Note that at the coil/stinger junction:

Itot = k1*cos(k2*x)*cos(wt) = k3*cos(k4*x)*cos(wt)

- as required by the laws of physics. Remember, it is
always implied that we are considering only the real
part of the phasor. Thus a current phasor can undergo
an abrupt amplitude and phase shift without changing
the real value.

10*cos(0) = 14.14*cos(45) = 10

The above phasor has abruptly rotated its phase by
45 degrees and increased its amplitude by 41% with
no violation of the laws of physics.

Ive used anti-sieze compounds, they also are basicaly zinc and grease
and often more economical than the Noalox and Penatrox brands.
I have two of the mentioned antennas,one was given to me and the other
I bought at a hamfest. Apparently the weak link in these is the traps,
now I have two antennas that I cant get to work. The next time I move
which will probably be soon I may have a place where I can at least
use them for parts.

Hi Jim,

I keep hearing about steel wool rusting in/corroding Aluminum, but does anyone have actual evidence? I've been looking on the web, and although apparently using steel wool on AL will cause warts, bad breath, and the downfall of the free world, all I've found is admonitions not to use it. Maybe I'll try an experiment - I have some old antenna tubing.

There's just something a little strange about this. For the steel particles to corrode the AL, they would have to detach, (easy enough) settle into pores in the Aluminum at sizes small enough to do that, (hmmm, those are pretty tiny steel particles) or have some odd property of sticking to the AL despite cleaning. Then I guess it's a race between rust and galvanic corrosion?

> Use synthetic scrubbies (3M ScotchBrite) instead.

Bronze or stainless steel wool might be a good material to use. Boaters use it on aluminum.

When you scour with the steel wool it will cut into the soft Al and
break off. You wont know about it until it starts to rust. Some
aluminum alloys dont seem to have as much of a problem with this but
others do. Ive had it happen to me, warned someone who still tried it
and had no problem.

Your landlord may show a disregard, but he can't actually do anything. As in, he can't evict you (what would be the grounds? whatever is in your lease/rental contract is superseded by federal law in this case) (granted, he can try to evict you, and you'd potentially have to go to court to fight it, but he can't get the sheriff out to remove you, and if he does a "self-help" eviction, he's committing a felony: breaking and entering, burglary, etc.)

CC&Rs are even more toothless here. There's a presumption that what you want to do is legal, and the HOA would have to prove otherwise, and in the mean time, you get to keep your antenna. Read the FCC page.

steel is much harder than aluminum, so the little fibers jam into the
relatively soft aluminum and make their own holes.

Then I guess it's a race between

The other thing to keep in mind with this sort of thing is the expected life. Hey, if it's only going to be up for a year or two or three, it probably doesn't matter. If you're going to expect your grandchildren's children to use it unchanged, a bit more care might be required.

2601. FS Yaesu G-400C Rotor and Controller

Newsgroup: rec.radio.amateur.antenna
Date: 2009-04-29 16:45:22 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <WA%JI.15735$pr6.6847@flpi149.ffdc.sbc.com>
Source record: 16070

FS: Yaesu G-400RC(like G-450A except no special plugs required for cable hookup). It comes with a copy of the manual. The rotator and controller work well and are in very good shape cosmetically. Cable hooks directly to rotor and controller/no plugs required. This rotor and controller have not been used much. I can send pictures upon request. Price is $165 plus shipping. Thanks, Charlie Hugg, K5MBX

2602. FS Tailtwister Lower Mast Bracket

Sorry for the of topic post but I don't know where to ask and it is my experience that people who build their own antennas can be rather resourceful.

I'm not sure of the correct terminology to use but I have been trying to find some "corrugated" metal tubing with threaded attachments on the ends. Kind of like item 50035A661 from McMaster.com web site. The problem with the one on McMaster web site is they are larger than I want and I am hoping to find something with a more standard machine screw thread too. Thanks for the help.

Helmut. Re original thread on dish

I found out what the problem was! The dish itself was in the antenna circuit thus
the dish was part of the antenna and receiving omni.ie chassis and ground was the same connection I have discarded the dish experiment and have gone back to the original design roots.
I can hold it up on one hand stretched out without problems and not only is it light but also small. Have placed a small cctv rotator and tipper on a table outside and am now setting up the controls. I suppose I will have to add a decoder to the motors at a later date so I can determine positions to follow the band conditions as they change I do not have a direction indicator so I will wait for a warm day where I can operate it and seethe position at the same time. The tipping action will give me control of the skip distance so that should prove to be very interesting. Anyway, glad that I now have direction ability back. Tks for your interest.
Regards
Art

Uh, what units did you say your constants k1-k4 had again?

> - as required by the laws of physics.

Is that supposed to automatically add credibility to any remark which
preceeds it? Thusly, the nano-particles emitted by the framistat at
an impedance discontinuity carry only re-reflected energy - as
required by the laws of physics. It does sound impressive.

David I still have that rotatable form for top band! I just gave up on large dish experiments! As I stated I like the idea of small and light antennas so I am keeping to those root desires. I am getting older so the idea of climbing towers has to be adressed. Thus as an engineer I solved that problem, now antennas where the height is not a necessity for low take off angles! I now have to find out what the greatest distance can be by substituting one skip for the presently used two skips ie min TOA.
Since there are not the usual sun spots one has to be inovative and devise means around it. I can still add a dish ofcourse but I like the idea of a pencil beam as it will add more gain to that single skip action. You really should get off that couch and figure out how you are going to handle a poor sun spot cycle. My cctv rotator will never be able to handle such a design when tipping is required as the weight would overcome the motor and it would point into the ground, they are built for just a small camera not a tank. By the way the antenna is good for 2 meg upto 170 meg which are the range limits of my MFJ 259 meter. My guess is that it is good for broadcast band upto a giga or more. Did you fall down?

>> anyone have actual evidence?

Yeah, the mast on my sailboat as done by a previous owner of the boat. It has some serious cosmetic corrosion and small pitting (but didn't effect the mast's functionality) where the PO used steel wool to remove some boat adhesive he accidently got on the mast. There were small pits in that area. This is not as serious as aluminun to stainless steel hardware bimetalic corrosion. SOP for a boat mast is to used threaded bolts, not self tapping screws and to tap the hole. Then we put in some version of Loctite (don't remember which one there are many varieties of Loctite) designed for the purpose and sold at boating stores among many other places. That minimized the bimetalic corrosion effect. I never had any problems with the masts on my sailboat after I enlarged the corroded holes a size larger and then tapped them and put the SS machine screws in. Using anything other than 316 SS screws is inviting disaster on a boat. Hardware starts to fall off boats.

BTW my small sailboat sank last year, but that had nothing to do with corrosion. My larger boat was donated to the Sea Scouts and I'm out of sailing now. Wife (and crew) has had arthritis and had a triple bypass a years ago. I just can't send her up the mast anymore :-).

The problem with stainless steel wool is that the consumer has little control over what it actually is. There are many grades of stainless and some grades do rust (as I found out when some got into my non-skid on my boat.) It not as bad as ordinary steel wool, but it was a problem, particularly when I bought it specifically to avoid rust on my boat(s). I suspect SS wool is not marine grade such as 316 and 304, the two most common types on boats...they have different purposes, but I forget what the differences and uses are for each one.

I haven't had a problem with bronze wool on a boat, but I think I'll stick to emery or scotch brite for my antenna...the 2nd next to do on my list.

Some lamps have flexible sections like you are looking for. I had one
that is about 3/8 inch in diameter that I made a microphone stand of.
Musical supply places also have such.

Take a trip to your local Home Depot or Lowes - plumbing dept.
Look for a "coil" of copper tubing - have them show you various sizes.
Though it's not corrugated, it is flexible - and you can use compression
fittings - or - soldered fittings with threads.
Makes for good 2-meter quad elements. use larger sizes for more bandwidth
smaller sizes are more flexible, of course - what size are you looking for?

my 2¢ worth
found that cents-key

That might work. I have never purchased hard line before. Any idea
where I can get some short lengths that is in the 1/4" range. I wonder
how hard it would be to pull the center conductor and dielectric out of
a 12" log piece?

That sounds like what I am looking for, but want something smaller. No
more than 1/4 or maybe 5/16" dia. It is to make my own lamps that will
be just a few 5mm LEDs.

The reason I am looking for the corrugated tubing is so it will stay
where I put it. It is for a small LED lamp. 1/4" dia is about as big
as it needs to be.

While searching, try the words corrugated tubing and bellows.
ThomasNet.com found over a hundred suppliers of metal bellows. Just
looking at a few manufacturers they found, 1/4" OD welded bellows and
tubing was relatively common.

It is hard to visualize yout needs expecially because of the small
dimensions.
The closest I can get to your needs is a corregated drinking straw
which is then covered by an adhesive metal foil or even a metallized
plastic sheet (not mylar) of 1 mil thickness which would be very
flexible

own corrosion.

>> Use synthetic scrubbies (3M ScotchBrite) instead.
>
> Bronze or stainless steel wool might be a good material to use.
> Boaters use it on aluminum.

Because boaters do not understand corrosion and electrochemical
reactions, they often choose poor materials. Brass is more cathodic than
steel, the 400 grade ferritic and martensitic stainless steels are more
cathodic than brass, the 300 grade austenitic stainless steels are more
cathodic than the 400 grades, and precipitation hardenable stainless
steels like 17-4PH lie between 300 and 400 grade stainless in being
cathodic. The more anodic a material is, the faster it corrodes. The
more cathodic (or noble) a metal is, the slower it corrodes.

As I said earlier, I have several good, introductory articles on
corrosion and galvanic series that I can send upon request by email.

According to Kraus, the standing waves are the *primary*
effect associated with a standing-wave antenna. Everything
else is indeed a secondary effect. The standing wave current
is about 90% of the total steady-state current. Like a low-
loss transmission line, a loaded mobile antenna can be
analyzed by assuming that it is lossless.

"Antennas", by Kraus, 3rd edition, Re: Standing Wave Antennas

Page 187: "A sinusoidal current distribution may be
regarded as the standing wave produced by two uniform
(unattenuated) traveling waves of equal amplitude moving
in opposite directions along the antenna."

Page 464: "It is generally assumed that the current
distribution of a thin-wire antenna is sinusoidal, and
that the phase is constant over a 1/2WL interval, ..."

Both of Kraus' statements assume a lossless antenna.

>> Note that at the coil/stinger junction:
>> Itot = k1*cos(k2*x)*cos(wt) = k3*cos(k4*x)*cos(wt)
>
> Uh, what units did you say your constants k1-k4 had again?

k1 and k3 have the units of current and are the magnitude
of the two standing-wave current phasors on each side of
the coil/stinger junction.

k2 and k4 have the units of degrees/unit-length so when
they are multiplied by x, the result is degrees. Of course,
it could be radians/unit-length.

As I discovered when I did a restoration and rebuild on my sailboat
about 10 years ago. All of the original interior woodwork fittings on
the boat were held in place by decorative brass screws. As the boat
was built in 1971, but the time I got to it in the late 90's all the
brass screws had "zincified" (probably not the correct term to a
metallurgist, but one that appears in boating literature). This
results in the screws having a pinkish color and they become
very brittle. Any attempt at removing them resulted in the head
breaking off or the Philips cross slot stripping out. I had to remove
all of these with a screw removal tool. They were all replaced with
coated SS screws, the coating for decorative purposes.

At least among sailboaters, who for some reason appear to be more
technically savvy than power boaters, galvanic corrosion is pretty
well understood at least at a layman's level. Most boat repair books
mention this and include the galvanic series and the relative
"nobility" of various metals and alloys. Those of us who sail in salt
water are also well aware of the need to put sacrificial zincs on our

boats to prevent damage to other metal parts. Replacing these is a regular part of our annual maintenance.

A very high percentage of sailboaters are also hams, far beyond our normal density in the overall population.

So the constants in your equations for current on the segments of a coil loaded monpole are: maximum current, wave number, and frequency; and the linear variables are time, and distance.

Of those things, only maximum current would have any dependence at all on the nature of the antenna. How does one know what value Imax to plug-in for each segment?

So I guess that ups the total now to at least two that we know of. Just exactly how many different kinds of alternating current do you reckon there are, Cecil? :-)

On the contrary, for the purposes of current analysis on
a standing-wave antenna, Kraus ignores everything except
the current in the standing wave. I don't have the 2nd
edition but the graphic I am referencing was in the 1st
and 3rd editions.

Chapter 14 in the 3rd edition is "The Cylindrical Antenna
and the Moment Method".

In the 3rd edition, it is Figure 14-2, Relative current
amplitude and phase along a center-fed 1/2WL antenna. He
gives the curves for length/diameters of infinity and 75.
Please take a look at that graph in your 2nd edition and
in particular, note the current phase plot. This is the
same current that Roy used for his coil delay "measurements".

Kraus shows that phase angle varying by about 3 degrees over
180 degrees of antenna. How can that phase possibly be used
to measure the delay in a wire? Since it cannot be used to
measure the delay in a wire, why would anyone attempt to
measure the delay in a loading coil using the same current?

> Of those things, only maximum current would have any dependence at all
> on the nature of the antenna. How does one know what value Imax to
> plug-in for each segment?

Kraus normalizes the feedpoint current to 1.0 and that's
good enough for me. The actual value of Imax obviously depends
upon the power incident upon the antenna. If one assumes a
current of 1.0 at the feedpoint of the coil, then one can calculate
the Imax at the base of the stinger given the Z0 of the loading
coil and the Z0 of the stinger. I can lead you through a
qualitative analysis if you so desire.

The point is that the current in a pure standing wave has
a different equation from the current in a pure traveling
wave. Any fields and waves reference book will have those
equations. The current in a pure standing wave cannot be
used to measure any kind of phase shift between points
because the phase doesn't shift between points on a wire
or on a coil. The current in a standing-wave antenna, like
a loaded mobile antenna, is primarily standing wave current.
Why do you think they are called standing wave antennas?

Kraus, in his book entitled "Antennas" ignores almost nothing about antennas. I don't believe that is a controversial point of view.

>> Of those things, only maximum current would have any dependence at all

Yes, unless of course you're talking about a real antenna with actual current on it. That is what I thought we were talking about. My recollection is that it was resonant on 75 meters, and the coil and stinger have very specific dimensions.

It might even be better to measure it - with some type of current probe device. Then you could solve for phase at any x or t you want.

No, actually the point was the name.

> Any fields and waves reference book will have those
> equations.

And what they don't have is different and assorted pet names for current.

> The current in a pure standing wave cannot be
> used to measure any kind of phase shift between points
> because the phase doesn't shift between points on a wire
> or on a coil.

If there is no difference in the relative phase of the forward and
reflected waves, then there is no change in the amplitude of the
standing wave in x. But when there is a change in the amplitude of the
standing wave in x, and I max is known, then determining the shift in
phase from the equation is a no brainer, Cecil. Other than Imax (and
you claim that assuming it's unity is good enough), there's virtually
nothing else that determines the amplitude of the standing wave envelope
along x. Helloooo.

< The current in a standing-wave antenna, like
> a loaded mobile antenna, is primarily standing wave current.

And you keep saying that as if it had some special significance.

you would have to melt it out of the corrugated type of hardline since it is
molded into the corrugation.

Gordon, I installed a large radio shack "tagi" type TV receiving antenna in my attic 10 years since the house came wired for it. I pointed the antenna in the general direction of the transmitting antennae in my area and received excellent analog reception even with the 5-10dB attenuation that occurs with VHF and UHF from the wooden roof with asphalt shingles. I even have a rotor but never had to really use it.

Now, with DTV, the exact same antenna gives me excellent reception as well, just as good as analog (but of course "better" due to the nature of DTV broadcasts).

I think for DTV that uses both UHF and VHF, you should be able to use the same antenna that you used with the analog system that used UHF and VHF and (as you know) you will probably find that the digital

signal is better in any case. Whatever their technology, these are all multiband receiving antennas and the spectra for DTV and analog TV are much the same. There are no technical aspects that need to be covered here because there really is no problem.

Your whole wave concept of the universe (sinusoidal vibrations) is
only part of the picture that is very very old and outdated. You
ignore another component, quantum mechanics, which requires a good
knowledge of mathematics to conceptualize well where possible to do so
at all. Even then, conceptualization falls apart when you try to
account for other phenomena such as exotic energy and matter and worse
when you go into specific theories that involve added dimensions to
our 4-D concept of the universe. You have been trying for years but
you will get nowhere looking for your holy grail as long as you
believe you have the answers because, alas, you are the only ham who
is thinking outside of the box. Humans cannot conceptualize the
universe in terms of a soap bubble and most cannot even express their
definition of a soap bubble in more than 3 dimensions. Only
mathematics can be used to express what you are attempting and
although the math may be understood, even the mathemetician or
physicist who derives his concepts usually cannot conceptualize them
in terms of their physical experience.

A lot of words. As far as mathematics is concerned I started with the
Mathematics of Gauss and Maxwell and found they were mathematically
connected. Nobody on this group agreed with that posture of mine. So
as far as mathematics goes with this group is straight out of the
window! Cecil tried that aproach and failed also. Now you are
proposing that mathematics is the trail that reveals all. Sooooo, be
my guest. I will do my best in following the trail that you have in
mind that you feel is better than mine. My guess is that you have
nothing in mind and are standing on sand like Andy Capp.

Go to EBay and search for USB flexible light. You'll find a flexible
tube about 3/16 dia with a head that has an LED, and a USB connector on
the other... They're cheaper than trying to source the flex tube
separately.

I guess a bit of background info is in order.
Last March (2008), I decided that I didn't want to pay
$52.00 a month to Comcast for the privelidge of watching
TV or watching my family sit on their asses zoning out
in front of the Boob Tube. So I dropped Cable.
Well, some TV watching is OK. So I hooked up the Rabbit
Ears and Bowtie to watch analoge TV. Reception was poor
to lousy. The problem is that I live in a Triplex that
is oriented East-West. All the transmitters are to the
east of here (in a roughly 10 degree cluster, less than
10 miles away). I am in the western most unit of the
triplex. Which means that I am trying to receive through
the entire length of the unit. The atic space is kinda
tough to get to. The living room has no atic space,
It has a highly slopped ceiling that pretty much follows the
roof line up and over the 2nd floor.
So last June I hooked up a DTV converter box. At first I
used the rabbit ears and got the same poor reception. Then
I tried a set top loop/rabbit ears (a little bit better).
Then I pulled the loop out, and plugged in an old bow-tie
(that made things better). Then I tried the bowtie all
by itself and things got much better. That's when I
decided that a bit more directionality might help. So I
cobbled up the current setup. Two bowties, 7" apart on
a wooden dowel, set in a weighted base. And it actually
works 98% of the time. Today we had good conditions and
the SSI was in the 50s to 70s (yellow and low green)
over all the channels (except for HSN, which is off axis
and I don't care about). So far I have not been able to get
a SSI over 80.
One thing that has helped with the current setup: I am allowing
the twinleads to fall freely down the dowel. I have one
on each side and I am using bread bag clips to keep the
leads separated from each other. It has made reception
more consistent across the channels.

So today I figured I would try to build a better antenna.
I got two dowels and some 14ga wire and (using some plans off
the internet) I built a Hoverman antenna. It didn't work
one whit better than the dual bowtie I already have. At
this point, I may move the hoverman outside and see if I get
better reception there. Or, since the bowtie works so well,
just add more elements to that one.

Absolutely amazing Guy = well done to you and Dallas for your
pioneering work. I already thought the Wellbrook array was a very good
antenna, but the Grayland QDFA just blows it away. Your recordings are
truly impressive. Thanks so much.

Changes followed by "|".

After a 30-day public discussion and feedback period to gauge reader
opinions in March of 2009:

http://groups.google.com/group/rec.radio.amateur.moderated/browse_thread/thread/d7d337db35
f23326

the rec.radio.amateur.moderated Moderation Team has decided to consider
amending its charter, and permit limited simultaneous crossposting to
rec.radio.amateur.moderated and one other unmoderated
amateur-radio-related discussion newsgroup. We are currently trying
this on a temporary basis (90 days, through early July 2009), and adopt
it permanently if successful.

Approved rec.radio.amateur.* newsgroups are those that are currently
listed in the latest version of the "List of Big Eight Newsgroups" which
is crossposted monthly to news.announce.newgroups, news.groups, and
news.lists.misc.

Approved alt.radio.amateur.* and alt.ham-radio.* newsgroups are those
that have been created consistent with the suggestions in "So You Want
to Create an Alt Newsgroup" at:

http://www.faqs.org/faqs/alt-creation-guide/

Approved regional hierarchy newsgroups are those that contain either
"radio.amateur" or "ham-radio" in their names, including
uk.radio.amateur and aus.radio.amateur.misc.

We will make every reasonable effort to keep our list of approved
newsgroups up-to-date. In case we have overlooked any, and a submission
is rejected in error as a result, the rejected submitter can E-mail us
at our administrative contact address (in the signature at the bottom of
this article, and the default Reply-To for the rejection message)
requesting that it be added, and that the article be approved. We may
still choose to reject articles crossposted to any alt.* newsgroup with
an inappropriate name, including obscene language, embedded
name-calling, or encouragement of unlawful conduct.

2649. Station With Center-Fed Dipole - Best Grounding Technique?

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-01 07:34:13 UTC
From: w5net@nomail.net
Message-ID: <899lv41u7v3c1vh5r7kp4a824as69apqso@4ax.com>
Source record: 15973

Okay, since I'm installing an entirely new setup, what I'm looking for here is the best way to ground my equipment and a large center-fed wire dipole.

Lets start with the shack first. The radio and speaker are both connected to the house ground through their power cords. To provide better RF grounding, I'm thinking of everything (including radio & speaker) connected with 1" copper braid to two salted (for increased conductivity) ground rods just outside. Is that sufficient?

Next, to reduce the likelihood of lightning reaching the shack, the only thing I can think of is a lightning arrester inline to two additional salted ground rods, with the coax disconnected when not used. I don't believe RF is an issue with a dipole, so is this sufficient for lighting protection?

Give me your opinions. Am I missing something? Is there a better way?

> phase from the equation is a no brainer, Cecil.

Jim,

I'm still reading, trying to understand the various arguments being put forward!

One thing I'm not clear about is your response to Cecil's point about phase measurements along a standing wave.

Please correct me if I've got any of this wrong: I'm picturing a half-wave antenna with a current standing wave in the shape of a (half) sine wave. My understanding is that if I could observe the current at a particular point along the antenna its amplitude would vary sinusoidally with time, and its peak amplitude would be determined by its distance from the centre of the antenna (and of course by the peak amplitude of the current at the centre).

If I could observe the current at several points along the antenna they would all be in-phase, in the sense that they would all reach peak amplitude at the same time, and cross zero at the same time. The only thing that would distinguish them would be the peak amplitude.

Cecil seems to be saying that, in a system like the one I've described, measuring the relative phase of the currents at two points along the antenna tells you nothing about their (electrical) distance apart. If I've misinterpreted him, I'm sure cecil will correct me!

Given that the currents all along the antenna are in-phase, Cecil's point seems so obvious - what am I missing? Or do you actually agree this point and I've misunderstood your position?

Regards,
Steve

Those 2 rods must be connected directly to your house power service ground with (i think) #4 or larger wire. This is a serious safety issue. This connection can NOT be through the green wire in the shack, it must be to the rod/wire that comes into the house.

Note also, this is NOT an 'RF ground'... There really is no such thing as an RF ground, ground rods are all about power line and lightning safety. Salting rods is really not necessary unless you are in exceptionally poor soil, and then its more the water you have to use to keep them moist that helps the most... even salt in dry soil can't help you.

again, don't put in separate rods, all rods must be hooked together and to the service entrance ground. if you have coax lightning arresters they should be tied to the same ground as everything else where they enter the shack. disconnecting the coax from the radio can't hurt, but may not help much either.

On the contrary, it was pointed out many times that Gauss's Law is one of
the basic Maxwell Equations, so they are definately bound to each other.

>So as far as mathematics goes with this group is straight out of the
>window!

So as far as your understanding of the Maxwell Equations, you are straight
out the window.

>Cecil tried that aproach and failed also. Now you are
>proposing that mathematics is the trail that reveals all.

unfortunately art has strayed so far off the trail that he'll need a
spiritual guide to help him back to the light of day.

Jim Kelley wrote:
> Cecil Moore wrote:
> Kraus, in his book entitled "Antennas" ignores almost nothing about
> antennas.

On the contrary, when Kraus talks about standing-wave
antenna current, he ignores everything except standing
waves. Here are some quotes:

"Antennas ...", by Kraus, 3rd edition:
Re: Standing Wave Antennas

Page 187: "A sinusoidal current distribution may be
regarded as the standing wave produced by two uniform
(unattenuated) traveling waves of equal amplitude moving
in opposite directions along the antenna."

Page 464: "It is generally assumed that the current
distribution of a thin-wire antenna is sinusoidal, and
that the phase is constant over a 1/2WL interval, ..."

Both of those statements assume nothing but standing wave
current on a standing wave antenna. Have you looked at
that graph of standing wave current amplitude and phase
that Kraus provides in "Antennas"?

>> Kraus normalizes the feedpoint current to 1.0 and that's
>> good enough for me.
>
> Yes, unless of course you're talking about a real antenna with actual
> current on it. That is what I thought we were talking about. My
> recollection is that it was resonant on 75 meters, and the coil and
> stinger have very specific dimensions.

Unfortunately, the simulation of a 75m Bugcatcher loading
coil violates the EZNEC segmentation rules on 4 MHz. To
avoid objections to such, I have used the 75m Bugcatcher
loading coil form factor on a loaded 40m mobile antenna
using about 14 turns. EZNEC doesn't complain about that
6" diameter, 4 tpi form factor used on 40m. That 40m
mobile antenna file can be downloaded from:

http://www.w5dxp.com/coil426.EZ

The current at the bottom of the coil is
1.0168 amps at 0.00 degrees

The current at the top of the coil is
.8179 amps at -0.06 degrees

In this case, the delay through the coil is unrelated
to the phase shift.

>> The actual value of Imax obviously depends
>> upon the power incident upon the antenna. If one assumes a
>> current of 1.0 at the feedpoint of the coil, then one can calculate
>> the Imax at the base of the stinger given the Z0 of the loading
>> coil and the Z0 of the stinger.
>
> It might even be better to measure it - with some type of current probe
> device. Then you could solve for phase at any x or t you want.

Roy already made the necessary measurements. All he needs
is help in comprehending the results. Unfortunately, he is
still suffering from the misconception that the current
phase that he "measured" is associated with the propagation
delay through the loading when it is not.

The phase of the current in a standing wave antenna
changes hardly at all through a wire or through a loading
coil. Running the above file under EZNEC proves that
statement. Roy has even, in the past, agreed with the
EZNEC results yet he continues to ignore the nature of
the current on a standing wave antenna as reported by
EZNEC. Go figure.

As Gene Fuller asserted years ago, the phase information
in the current on a standing-wave antenna is buried in
the current magnitude measurement, not in the current
phase measurement. You seem to agree.

But Roy did NOT use the magnitude measurement to calculate
the phase shift!!! I explained how to take the ARCCOSine
of the current normalized magnitude to calculate the actual
phase shift through a wire more than 5 years ago. He called
the concept gobbledygook, plonked me, threatened to refund
my EZNEC purchase price, and revoke my customer support.

An EZNEC simulation using the *SAME* 40m loading coil above
using traveling wave current, showing an actual phase shift
of ~40 degrees is at:

http://www.w5dxp.com/coil426s.EZ

The current at the bottom of the coil is
1.0053 amps at -3.25 degrees.

The current at the top of the the coil is
.90356 amps at -43.43 degrees.

In this case, the delay through the coil is proportional
to the phase shift.

Hopefully, you or someone else who understands what I am
saying will contact Roy about his conceptual blunders.
He keeps trying to avoid the discussion of large bugcatcher
loading coils by retreating to the shelter of a small
toroidal coil which more closely matches the lumped-circuit
model along with his mistaken concepts. Unfortunately, his
small toroidal coil bears no resemblance to a 75m Texas
Bugcatcher coil which is the subject of the discussion.

Stewart,

The advice Dave gave is good.

There is no perfect grounding installation, every one is a compromise to some degree. So I will describe a "close to" optimum setup and yours will be a compromise, but try to make it the minimum compromise you can.

There are three grounds to be aware of. Safety, RF, and lightning or surge.

1. You are already covered for safety with the green wire ground.

2. You don't ground your equipment for RF grounding. Only some antennas need one, such as a vertical. Your dipole does not.

3. Lightning and surge protection ground - There should be only one grounding POINT, and it has already been established. It is the ground the power company uses. Any other ground you establish has to be connected to that one, as Dave described. The objective of surge protection is to keep the fireball outside of your house!! If you don't allow surges into your house it really simplifies the job of equipment protection.

All conductors that come into your house need to be protected with proper surge devices. That includes telephone, cable tv, your 220 volt power, and your dipole coax. Ideally you have a plate (some think it has to be copper, but it can be aluminum as well) mounted right at the ground rod and on it you have a telephone line protector, a cable tv protector, and your coax lightning arrestor. Polyphaser and others make such devices. But the most vital of all is one that goes on your power line. Why ? Because any of these conductors can bring a lightning surge into your house, but the one that is most likely is the power line. It is called a whole house protector and it usually is installed by an electrician at the circuit breaker panel. The telephone line probably has gas tubes protecting it. Cable TV will have a little block, hopefully tied in already but it doesn't have gas tubes in it so it can use help.

In the way of compromises, usually you have to bring in the coax at some other point. If you do, you ground the coax shield with the lightning arrestor to a ground rod, but as Dave described that rod has to be tied to the power company ground. Etc. etc.

If you had residual surges that you were concerned with, AFTER you did all the above, then the next step is to bond all of your equipment together and tie it to the ground point.

As you now know, if your shack is not located next to the ground point mentioned above, you have to provide a good and short conductor to that

point.

Good luck.

Rick K2XT

So it has now come down to a big lie. Years ago there was total agreement on this group that the Gauss law of Statics has no connection with the laws of Maxwell. How soon you have forgotten your auguements with Dr Davis on the same subject. Now we come to a stage where the antenna and its mathematics are real and all join to say I knew that all the time or that is nothing new. All those years of discussion, which are still in the archives as witness to the big lie now turned upon it's head.
What has your lieing gained you over the years? Do you now feel it has enhanced your reputation?

Exactly! You and I are agreed that the *amplitude* holds
the key to the phase shift *through a straight wire* so
you are preaching to the choir. The phase of the total
current on a standing-wave antenna is unrelated to the
delay through the loading coil.

Unfortunately, the current "bulge" through a loading
coil causes an error in the simple "no-brainer"
calculation that you are suggesting. Some other method
of determining the phase-shift/delay through a coil is
needed.

That other method is to load the loading coil with
its characteristic impedance and measure the phase
shift in the resulting traveling wave.

For instance, in the coil426.EZ file from my web
page, the current at the bottom of the coil is
1.0168 amps at 0.00 degrees. The current at the
top of the coil is 0.8179 amps at -0.06 degrees.
The maximum current in the middle of the coil
is 1.1092 amps at -0.04 degrees.

The total current equation through a loading coil
is not a simple cosine function like it is through
a thin-wire. Determining the actual delay through a
loading coil is apparently NOT a no brainer.

Hi Steve,

Yes, I think you have it right. But there's more to it. Typically we
wouldn't measure the amplitude of the standing wave envelope. We
would make a measurement of either the forward or the reflected

traveling wave, which are phase delayed along the antenna. Cecil seems to believe that he has cornered the market on making such measurements. Although he has proposed an interesting method for making the measurement, others have also made it using conventional techniques. But he lambasts them, unfairly and incorrectly. I guess you had to be there. :-)

Thanks,

ac6xg

That is where you are mistaken. The total current on a
standing-wave antenna is primarily standing wave current.
What you are saying is that we wouldn't typically measure
the total current. On the contrary, total current is exactly
what we would typically measure and is exactly what w7el
measured. That's why he measured a negligible phase shift.

> We would make a measurement of either the forward or the reflected
> traveling wave, which are phase delayed along the antenna.

I'm sorry, but that is a false statement. Measuring the forward
or reflected traveling wave, which is less than 10% of the
total energy on the antenna, is exactly what is the problem.

Traveling waves on standing-wave antennas are very hard to
separate and measure. Exactly how do you propose to separate
the forward wave from the reflected wave while preserving the
amplitude and phase of each?

Hint: w7el used the total current for his "measurements".

> conductivity) ground rods just outside. Is that sufficient?

Maybe a few questions might help clarify what you're trying to do, and
what your objectives are.

What is connecting the radio and speaker to an earth ground doing? Are
you hoping to provide an alternate path if the AC line shorts to the
case inside? The green-wire ground does that very nicely.
Are you thinking that RF currents will flow from radio chassis to
ground? The RF current should be in the antenna feedline, only.

In general, an earth ground for your equipment isn't needed.
(Consider this.. an airplane has lots of radio gear, external antennas,
etc. and gets hit by lightning, and still keeps going, and there's no
connection to earth ground)

>
> Next, to reduce the likelihood of lightning reaching the shack, the
> only thing I can think of is a lightning arrester inline to two
> additional salted ground rods, with the coax disconnected when not
> used. I don't believe RF is an issue with a dipole, so is this
> sufficient for lighting protection?

Do you care about electrical code compliance?
There are specific rules in Article 800 of the NEC.

There's several issues here. What's the overall goal? protect the house
from burning down (but sacrifice the gear if needed) or protect the gear
at all costs? Protecting against direct strike on antenna or induced
voltages from nearby strikes?

House burning down is handled by using a listed antenna discharge unit
(ADU) connected to a suitable lightning dissipation ground. (salted rods
are not a suitable lightning dissipation ground, but more anon) The ADU
has to be mounted outside, close to the point of entry into the house.

The ADU will make sure that most of the lightning current is safely
conducted through something other than the flammable stuff of which your

house is built. But, it might not save your gear (for a variety of reasons).

If you want to have a better chance of saving the gear (aside from disconnecting, in which case you need to short the incoming antenna connections to the lightning ground, as well.. don't just leave it open), you want to do what is good practice for EMI/EMC anyway. Have everything referred to a common potential. In a sort of idealized scheme, you'd have your AC receptacle mounted on a conductive plate which also has the antenna feedthrough. The plate is bonded to the electrical service ground (so the breaker trips if there's a short inside your gear) and is also connected to the lightning ground (since that's where the antenna surge is going to go). A listed transient suppressor is connected to the AC line and the grounded plate as well.

Now, all the gear (radio, speaker, etc.) is all connected to this one plate, so if lightning hits, and there's a many kilovolt drop in the grounding wire, everything goes together, and you've minimized the voltage between any two conductors connected to the radio.

It's the airplane thing... the lightning hits the airplane, but everything inside the airplane stays at the same potential relative to itself so there's no problem.

You'll hear a lot about needing a big flat ribbon for lightning ground. Maybe, maybe not. Here's why. If it's any length at all, the lower inductance of the flat ribbon is still high enough that the voltage rise at the panel (L di/dt) from the lightning impulse is still hundreds or thousands of volts. If your system can take 1000V rise, it can probably take 5000V, so the absolute rise isn't as important. And, a higher inductance, higher resistance conductor actually slows down the transient a bit, which reduces the currents induced by the magnetic field. Lightning may be a huge current, but it's short duration, so it actually doesn't take a very big wire to carry it (AWG 10, for instance) without melting.

The key here is to understand what you're trying to do, and how you're doing it. Don't blindly assume that since radiotelegraph stations with beverages and longwires in 1920 used big ground rods that's what you should be doing in your shack today.

Now.. about rods, ground, salting, etc.

Your ground should be a concrete encased grounding electrode (aka Ufer ground), which is what the electrical code requires. Rods can be used for supplemental grounds, but you have to worry about making suitable connections (exothermic welds, etc.), the soil drying out, and the generally high resistance of ground rods. Salting eventually washes out, so isn't worthwhile in most cases. There are soil additives (e.g. bentonite) that are used in connection with grounding, but they work by being very hygroscopic and keeping the soil conductivity high by keeping

water in the soil. But overall, the Ufer ground is your friend: low resistance, reliable, large area (so current density is low.. no "smoking rods").

The code requires that ALL grounds be bonded together with a suitable conductor.

Let me amend that statement which is misleading.

The standing wave current on a standing wave antenna,
which w7el used for his measurements, accounts for 90+%
of the total current. He essentially measured total
current, not traveling wave current.

I think if you contacted Roy directly, he will admit
that fact.

Well David
I have now finished all my work on the antenna except for a couple of
bells and whistle that can wait for the balmy days of summer. Swr
along the frequency span
is similar to that of a log periodic with a slight waveiness but that
can be altered remotely quite easily as well as a couple of other
things.
Jim, I will be finished on the other today and will be in UPS on
Monday.
I will not test before hand but leave that up to you. Will E mail you
later with details
By the way David, the antenna will stay at ground level and I will
take the one off the tower as height is not now a consideration
I suppose I will now have to think about taking the tower down as it
is not needed anymore which will make the wife happy.
This week end is now for the wife and her birthday. After that I will
exercise the new antenna with a special look out for you.
Regards, your adversary
Art

> > - Show quoted text -

Note
Classical physics still reigns supreme. It is what is followed by all
the masters
including Newton,Heaviside, Gauss,Maxwell,Einstein and others.
Einstein never abandoned classical physics as the subject matter of
the Universe.
If a movie is made by a director and supporting characters it is the
same movie that is viewed from the outside by an observer. Einstein
observed the same movie that was made by others from the inside
whereas Einstein viewed it from a different vantage point. Thus
Einstein stayed with the classical and certainly did not view or
describe a different movie
My antenna ideas and thoughts stay completely within the bounds of
classical physics. The speed of light is determined by the passage of
a particle when propelled by a time changing magnetic field. That same
particle emits light as it expels kinetic energy when passing to or
from different boundaries formed in the Universe under the rules or
laws of partial pressures. Thus the speed of light is the acelleration
of the formation of a magnetic field , this is the same speed imparted
on a particle when impacted with same. Light is emitted from that same
particle or mass when it expends potential energy into kinetic energy
by the laws of partial pressures. It all comes back to the
derivitation of the Grand Universal Theory, where all progress from
the four standard forces as predicted by Einstein. All the above is

that enacted by my antenna via Classical physics, no waves, just the
impact of force upon mass

Hmmmm. Perhaps I misspoke. I should have said that's what I usually measure when I want to know how much power my antenna is radiating. I guess I don't actually know for sure what other people usually measure. But if they have a Bird wattmeter for example, that's what they usually measure too.

The context, as proved by your first posting above is
measurements "along the antenna". Why do you need to divert
the issue by changing the context in midstream? Why can't
you just discuss things in context?

A Bird wattmeter will not work "along the antenna". Contrary
to what you assert above, *nobody* uses a Bird wattmeter
"along the antenna" to measure anything. A Bird wattmeter
is a 4-terminal device requiring a reference which doesn't
exist "along the antenna".

The only measurements that have been made "along the antenna"
are total current measurements. Seems the only way to measure
forward traveling waves "along the antenna" is to use a
traveling wave antenna like a terminated rhombic.

Hi Jim,

For the sake of Steve's interest, it would be fair to point out that
no one measures current along the antenna, but many measure the
current INTO the antenna (it is/was, in fact, the preferred method for
FCC power measurements of AM Band transmitters). And by measuring
current INTO the antenna, with it tuned as a resistive load, there is
no issue of reflection. Beyond the feed point, conventional teachings
inform the FCC of expected performance.

Not that Jim has suggested it, but I find it extremely unlikely that
anyone uses a Bird Wattmeter to measure current along the length of an
antenna (of any size or in any state of match) - however, the
electronics of the Bird (and more so the Bruene SWR bridge) could make
it achievable.... except.

Except the lead making the remote measurement would introduce a
significant error as it would inhabit the fields and disturb them.

Another method is the in-line current meter with a meter readout. Then
that meter is read through binoculars. Years back, such a method was
used to kick-start a manufactured controversy which embers now
struggle for oxygen in the ashes of this thread. You will recognize
the flicker of that spark with one word: phase.

Steve, the elements of this discussion you find lacking clarity (in
what would seem an ordinary observation to you) are leveraged meanings
that are the prelude to a larger proof (sic). To follow it, you would

have to suspend your inclination to question odd re-definitions of perfectly understood concepts and invented terms that "supplement" conventional science. If you refuse to suspend your judgment and ask a question along the way, chances are that trolley will jump the tracks. Otherwise, how could something so ordinary take 300 posts to arrive nowhere?

Yes, bla bla bla, whine, etc.

Here is a photograph of a directional wattmeter converted to measure
current on W8JI's web page.

http://www.w8ji.com/building_a_current_meter.htm

Jim & Richard,

I guess I'll retire gracefully because I'm not privy to the "history" between individuals on this Forum and I'm now not even sure when answers are to be taken seriously or as a joke.

Jim's most recent posting is a good example. We were talking about measuring current along a dipole. I assumed that would mean measuring the standing-wave current, but Jim introduced the notion of measuring travelling wave currents. When challenged as to how we might do that, we got a URL pointing us to a simple standing wave meter - it certainly can't discriminate Forward and Reverse.

From other postings I've read I take Jim to be a pretty knowledgeable guy - so this has to be a wind-up, right?

Steve

IT DOES NOT MEASURE FORWARD AND REFLECTED CURRENT!
IT ONLY MEASURES TOTAL RF CURRENT!

That's exactly why w8ji "measured" a 3 nS delay
through a 100 turn, 10 TPI, 2" dia loading coil.

Dr. Corum's formulas predicts a velocity factor
of 0.033 on 4 MHz for w8ji's coil. That would
make it 37 degrees long with a delay of 26 nS.

W8JI "measured" a 3 nS delay because the standing
wave current that he used for the measurement
does not change phase relative to the source
phase in a wire or in a coil.

Do you really believe that RF current can travel
through 53 feet of coiled wire in 3 nS? Doesn't
26 nS make a lot more technical sense?

Steve, there are a handful of people on this newsgroup
who will stoop to anything to defend W8JI's 3 nS delay
through a 75m loading coil. It's a lot like a barnyard
pecking order devoid of technical content where the
laws of physics don't seem to matter at all.

I would be glad to step aside and let you shoulder the
technical side of the argument. It would be interesting
to see if the powers that be would expose a newcomer
to the same ad hominem attacks and obfuscation as they
heap upon an old-timer like me.

I think that is pretty accurate Cecil.
Richard took to argueing with Dr Davis working at MIT
where he argued that the Laws of Maxwell do not equate mathematically
to the laws of other masters.He was speaking in his normal Olde
English term which is talking instead of communicating until he drove
the good Doctor away in fraustration.
Richard took that as a victory for Shakesphere over the degree in
mathematics that
Dr Davis earned. Richard now believes he has advanced in the pecking

order in matters relating to Radio no less.

I just happen to have the answer for anyone with EZNEC. The
following EZ files have been modified to run with the free
demo version of EZNEC.

The following inverted-V antenna is a standing-wave antenna.

http://www.w5dxp.com/inv_v.EZ

The segment currents in one half of the inverted-v look
like this:

```
EZNEC+ ver. 4.0
actual dipole 5/1/2009 5:12:15 PM
--------------- CURRENT DATA ---------------
Frequency = 3.644 MHz
Wire No. 2:
Segment Conn Magnitude (A.) Phase (Deg.)
1 W1E2 1 0.00
2 .97807 -0.33
3 .93414 -0.65
4 .86875 -0.94
5 .78291 -1.21
6 .67796 -1.46
7 .55552 -1.70
8 .41724 -1.94
9 .26438 -2.17
10 Open .09505 -2.40
```

The following inverted-V antenna is a traveling-wave antenna.

http://www.w5dxp.com/inv_vT.EZ

The segment currents in one half of the terminated inverted-v
look like this:

```
EZNEC+ ver. 4.0
actual dipole 5/1/2009 5:22:42 PM
--------------- CURRENT DATA ---------------
Frequency = 3.644 MHz
```

Wire No. 2:
Segment Conn Magnitude (A.) Phase (Deg.)
1 W1E2 1 0.00
2 .99572 -8.77
3 .99064 -18.12
4 .9799 -27.18
5 .96293 -36.30
6 .94055 -45.74
7 .91497 -55.78
8 .8899 -66.70
9 W3E1 .87103 -79.05

Wire No. 3:
Segment Conn Magnitude (A.) Phase (Deg.)
1 W2E2 .86769 -87.01

The two antennas are identical except one is terminated in
its characteristic impedance and one is not. This is the
best way I know of to illustrate the difference between
the currents on a standing-wave antenna and the currents
on a traveling-wave antenna.

A point of correction here. I believe you will find the notion detailed on Cecil's web page.

Please let me apologize for my error about the nature of the article. You are correct. The 'calibration fixture' featured in the 2nd photograph is directional. An examination of its inner workings would of course reveal circuits which measure currents and voltages in traveling waves. It is to circuits such as those that I have referred.

> From other postings I've read I take Jim to be a pretty knowledgeable

He's a guy with a limited amount of time and patience honestly attempting to subvert the ridiculous by stating the obvious. Most everyone here has already given up trying. Good luck to you, should you decide to try it.

Hi Steve,

You have now noted the greater contribution of comedy that inhabits these discussions. Unfortunately, and as you indicate, those thin jokes are rather in-bred.

>Jim's most recent posting is a good example. We were talking about
>measuring current along a dipole. I assumed that would mean measuring
>the standing-wave current, but Jim introduced the notion of measuring
>travelling wave currents.

Ah! The history you are unaware of (and it hides in the terms of invention that populate the theories being assembled behind the curtain) is that BOTH currents are under consideration. Unfortunately, and you have the capacity to appreciate this, some characteristics of one are migrating into the conversation of the other. Hence, we return to the keyword: phase.

In one realm, phase is pointless, in the other, it has significance. As the term phase migrates between the two, both realms' discussion are polluted.

>When challenged as to how we might do that,
>we got a URL pointing us to a simple standing wave meter -

Not really. It is a simple current meter - the page literally shouts that out.

> it
>certainly can't discriminate Forward and Reverse.

That is correct, but I mentioned such discrimination is possible from the Bruene SWR bridge. As I wrote previously, no one measures forward and reverse currents on antenna elements. Construction examples would be rare.

With care and practice as offered at the link, which attends the issues of error (largely dismissed from the greater consideration of "measurement" proofs offered), the Bruene style could similarly be achieved. It is neither a difficult concept, nor a technical hurdle.

>From other postings I've read I take Jim to be a pretty knowledgeable
>guy - so this has to be a wind-up, right?

Give it another thousand postings sprinkled over the decade to do
that. We have barely given up on fractal antennas.

At how many GHz?

The problems of poor reporting are creeping into the lack of specific
questions.

An example:
Inventor
I have this patent that proves my technology.
Questioner
It shows the reflector is smaller than the driven element;
it shows the director is larger than the driven element;
Does this prove the Yagi no longer works?
Inventor
[silence/mumbling/outrage] I didn't come here for ad hominem!

Yes, the total measured current on a standing wave antenna
is primarily standing wave current. The total measured current
on a traveling wave antenna is primarily traveling wave
current. Please see my last posting.

> He's a guy with a limited amount of time and patience honestly
> attempting to subvert the ridiculous by stating the obvious.

Obviously, a 100 turn, 10 tpi, 2" dia 75m loading coil cannot
have the 3 nS delay that W8JI "measured". Do you disagree?

A reflector can be shorter or longer than the driven element in planar
designs especially Yagis with two reflectors. Shakesphere should have
told you that !
David, the antenna covers the distance covered by a mfj 259 b which is
1.7 to around
175 mega hz. Obviously it therefore has no limits above .Below I
cannot measure unless I modify my radio outside the amateur bands, ie
reflect swr outside the ham bands. Beam widths I can't determine as I
do not have enough segments available on my optimizer program . But I
believe that can be accomplished.
Check out the SK list regularly as I may leave the answer in my will
if it mentions you.
Art

but wait... you have built it.. you can measure the swr, so why can't you
measure the beamwidth? pick an AM broadcast station and turn it and see how
wide the pattern is.

Hi Steve,

I hope you are still following the thread, because as bad as the
theory gets, there is always room for instruction - just not in phase.

I will expand on my comment of both the meter pointed to, its
construction practices, and the topic of accuracy (something everyone
offers, but can never prove).

First, as to its standing wave meter capacity (in terms of
conventional SWR meter usage). The last word, capacity, arises in
Tom's (W8JI's linked to) page:
>The lack of large metallic components minimizes stray capacitance
and
>I did not add a Faraday shield because the shield would increase the capacitance
I am now leveraging the word capacity to mean ability in contrast to
Tom's literal engineering application - and yet there is something to
be said about such a meter having the "capacity" to measure forward or
reverse products (as would a conventional SWR meter).

Capacitance is required to give the meter the capacity (ability) to
measure these currents. The Bruene SWR bridge has one side that is
driven by an inductive coupling, and the other side driven by a
capactive coupling. Through the combination of the two, the PHASES

contribute to either a reverse or forward energy product (conventionally expressed as power). Clearly the link at Tom's page illustrates half of the Bruene SWR bridge, and if that Faraday shield had been tapped (instead of discarded), the meter could have revealed the separate currents.

But nobody is interested - it offers nothing new. You will find 0 to no construction examples of this more than rare application. Futher, given its absence of discussion here in all these years, no one is actually interested in "measuring" what they have proven through their measurements.... Sorry Steve, another in-bred joke.

Moving beyond the hillarity that ensues from these obvious shortfalls of academic navel gazing; there is still the accuracy to consider.

On the face of what is offered at Tom's page, there is an immediate and irrevocable error of 5% built into the instrument as described sitting in its calibration fixture. Under other circumstances, that error could easily eclipse 100%. Suffice it to say it will never achieve better without a small book of charts.

As I offered, accuracy is often claimed, but rarely (never) proven.

This is a simple counter-proof. Tom expresses it without being aware of the implications:
>T1 is a current transformer. ...
>When the single turn primary (a whip or mast) has 1 ampere,
>the secondary will have .05 amperes (inverse of the turns ratio).
all very standard stuff as you may well note. Going on:
>This type of meter is much more reliable and linear
>than thermocouple RF ammeters, and perturbs systems much less.
This, of course, is related to the "stated but not proven" class of statements that litter the WWW (much less this thread).

Here is the literal error:
>I've applied 50 watts to a precision 50 ohm load,
>making wire current 1-ampere.

Let's assemble these statements. We have a current transformer. It is loaded with 100 Ohms with a lightly coupled linear indicator. It has 50 Watts applied through it to a load. That load is 50 Ohms.

What the meter should indicate is a current of 0.9535A if we are to believe that the 50W is absolutely accurate (it is not, but we will skip that for another discussion). The author, Tom, offers to trim the potentiometer for a 1.000A reading - WRONG!

How can this be? It is all in the statements offered above. The current transformer is also a RESISTANCE TRANSFORMER. That 100 Ohm load to its secondary is cast into the primary as an in-series 5 Ohm resistor adding to the 50 Ohm nominal load. The instrument is injecting itself into the measurement and this presents the statement:
> perturbs systems much less.

in a new light as it is quite easily demonstrated exactly how much (if we ignore other sources of error) this construction example will perturb the system and nothing is said in comparison to the technology being replaced (thermocouples). Such is poor reporting.

What becomes of that error in a short monopole whose radiation resistance is equal to that 5 Ohm insertion loss?
>FS accuracy is not required in comparison measurements,
True enough, but it then ignores what I've offered above:
>since the meter references against itself.
a 5 Ohm instrument load in series with a 5 Ohm radiator (irrespective of phase contributions due to size) will seriously change the fabric of the system. Such is the compounding of poor reporting.

If one were to claim to have made ANY current measurements, and then wholly ignore the contribution of errors, then the discussion of phase in a system such as a 5 Ohm radiator with a 5 Ohm instrument loss is going to be absurd. Such are the fruits of poor reporting.

I dont know if Dave built it or not but I did and tested the beamwidth
just as you said and got 360 degrees. Rotating it had no effect at all
on signal strength. I tried it on 2M and couldnt hit the local
repeater with 1 watt normally I can reach it with 100mW. I would say
this classifies the antenna as a dummy load.

The resistance is transformed in the ratio of N^2:1, which is 400:1 for a 20:1 turns ratio. So the insertion resistance is 100/400 = 0.25 ohm, not 5. I'm confident it works as Tom claims.

But Jimmie I have not divulged the full story. It is up to you to
determine the merits of antennas that you make without posessing the
full instructions. I was intent on sharing all with my fellow hams but
after the pilloring of the Dr who came on board so that he could help
with the problems that the group were having with mathematics and
Maxwell it appeared to me that most thought all was known about
antennas thus all is known about mine. I don't mind if you think it is
a dummy load since I do not know the merits of your education. You may
well be the same person who was argueing at the same time who admitted
to never graduating from high school.
David
I have ordered some remote relays so that I can operate the camera
scan and rotate
mechanism that I use to carry the antenna and every thing takes time.
I would also remind you that beam width can only be determined in
terms of point to point transmissions and grazing angles on ground
level antennas can create havoc.

Either way, you never did concur with the mathematics presented on this antenna so
I thought you should drop the subject all together since you seem to be my superior in these matters and feel you have proved my mathematics in error. Suffice to say I have described the abilities of my antenna and care not whether you can believe it or not until you delve more into Maxwell's laws in light of what I have stated. Rest assured that Richard still agrees with your assesment a judgement you should feel confident about. Grin
Let us move on and let somebody else take over this thread for their own use which is now coming to be the norm.

Many times things go out one ear and out the other, perforated ear
drums does that for you. You have not yet recanted your position on
Maxwell's laws and I told you everything. Without recanting your
position on Maxwell then all I state obviously goes in one ear and out
the other. From what you stated on Maxwell it is obvious that my logic
on every thing is not acceptable to you. From your stand point I am a
liar with respect to my antenna as you have deemed it impossible. From
a person who knows all that there is to know about antennas you
discussing it more seems quite sense
less. And yet thru the years nobody has pointed out an error in my
statements.
If one did so and me knowing that I have such an antenna I would have
to rethink my logic as to why it works the way it does. It is small
and light enough to hold out on one hand and works on 160 which you
say is impossible. And you are correct at least in your own mind since
you have stuck with planar designs despite its contradictions with
Maxwell.

Art is careful to never give every detail. Experience has taught him
that doing that leads to the quick thud of deflating claims. Like
Cecil, always arguing about a detail means never having to say you're
sorry.

>You can't possibly have missed that, Richard. Art has stated
>it dozens of times. Maybe hundreds.

Well, perhaps 11 times or 99, I pulled the plug on him and only hear
his postings as static behind other conversation. 10 years of his
dull needle stuck in the same worn groove has lost its -um- charm.
Same thing for Cecileo's preaching from the gallows hoping that the
last fall will give him enough swing to kick someone in the nuts.

Hi Roy,

Yes, quite so.

>not 5. I'm confident it works as Tom claims.

It works as it claims is obvious, but not for SWR (neither claimed,
nor something you show interest in) - not that it should, but could.
We aren't going there either (few would as such an application has no
obvious merit). Pursuing the topic of reported phase does not appear
to be productive. A curiousity all around.

No, that you caught me in a detail with that detail mishandled by me.
Complements! The detail was quite accurate; so much so that you
accepted it (it was also sourced by Tom) in your reply. That is the
value of good reporting. The net result is a very short transaction
of point-counter point that doesn't demand 300 posts of careful
parsing. My fault was poor application, certainly. You probably
stole Art and Cecil's delight at catching me there. ;-0

no, i am waiting for the final tweaked design. if you have built one to art's specs then you are probably measuring just the side/back lobes, which is a very good sign. if it has a pencil beam on 160m, then by the time it gets to 2m the beam will probably be so thin that it will be like a laser beam, so you'll have to be pointing it VERY accurately on the repeater. so go rotate it again, very slowly and carefully, and don't forget to aim it in elevation also!

Hold on. I don.t know if I have a pencil beam as I can't measure it or
model it.
However, I don't see that as a real hurdle! The idea that the beam
width changes with frequency is beyond my ken. As for a final tweaked
design, for a ham that is an impossibility

but you do have one that is built to your spec right? and you can turn it
by hand? so if you point it at a local AM station can you see a big
increase in signal strength and a good front-back and front-side ratio?? I
don't need a 'final'design, as you say that is impossible for a ham, but
i'll settle for something better than a 4-square for 160m that i can turn
with a normal rotor!

Tom hes too thorough.
I think hes just a troll, maybe he,s the real Arts grandson or
something. Hes too consistent to be as blithrering as he acts. Maybe
he is just some old fart that likes to stir up conversation and gets a
kick out of how long of a thread he can create or how many hundred
words he can get someone to write.

His "antenna design" isnt origonal. I am not sure what the origonal
source was but I know at one time it was used as a joke among CBers.
They would describe it to some newbie and get him to build it and put
it up on a tower and make him jump through as many hoops as possible
to get it to work. So maybe he is just one of those from the CB
usegroup having fun with hams.

Jimmie

> with a normal rotor!

Yes you are correct. But I am waiting for some remote relays for the
rotator scan and asmith control and some other things with respect to
the antenna. Ordered from China
so it will take a bit more than a week from now, then I can do as you
say. For beam width changes I also need a adjustment contraption to
change up or down from what I have now but that is a summer job ie
bells and whistles. I have Jim's sample antenna packed and ready to go
and he is probably more experienced in that area, when I receive his
address via e mail, it is packed in a priority mail container. He can
pass on what it does but without comment with respect to construction.
Construction details are private and I am not going to disclose those
until there is a climate change.
At the moment Jim is the only guy I can trust on the newsgroup and the
only guy I have great confidence in so if he provides a finding I can
believe it as it will be specific and to the point As far as the four
square goes without change in azmith I don't believe it can compete
but we will see.
Having a get away week end at the moment with the wife antennas have
been put to one side.

Yes, I remember the "Dr." (or perhaps doctoral candidate) from MIT who jumped in and remarked that according to his model, when you mathematically 'freeze' the motion of charge to a single point in time (t = x seconds), that, glory be, Gauses law of statics (preservation of charge) still holds true according to his computer results.

This may be of mild interest to scientists who question if the charge would be preserved statically (perhaps some energy must be lost to the dynamic motion of charge for example), it had nothing to do with what you were writing. Once the "poor Dr." saw what you were up to, he politely decided to exit stage right never to return again.

Why do you keep coming back with different names and different packs
of lies
John E Davis can be found at his home page @space,mit edu where he can
himself
tell you that you are lieing. Better still, read the archives of this
newsgroup for the truth
We all know who and what you are. You can run but you can't hide.

Now , now, Cecil. you cannot equate a coil with electrical degrees of
an antenna.
Lumped loads are not included in the laws of Maxwell only distributed
loads

Then why are you here. Are you a judge? You always appear depressed or
mean spirited. Maybe when you hinted on your designs you got slammed.
I am fairly sure that they did not follow the edicts of Maxwell.

Nope on the judge. I merely apply "common physics" to know you are
thinking in the "imaginary plane".

And mean spirited? What have I ever said to you, as opposed to Richard,
that could be presumed to be mean spirited? Google has all of it
recorded forever more. SHOW ME!

> Maybe when you hinted on your designs you got slammed.

My designs have taken first place in several antenna competitions in the
"non-commercial" category. And sometimes first second third and fourth
in the same one. Almost always first place in every band I entered one
which was as many as 3 at an event. For lousy common style engineered
antennas,as opposed to your whizbang revolutionary ones, I've done okay
I guess.

> I am fairly sure that they did not follow the edicts of Maxwell.

I wouldn't know, since you seem to be the only one who has a copy of his
edicts.

You're awfully demanding of information for someone who probably isn't
even named Dave.

Here's one of the years that's available online.

http://www.csvhfs.org/ant/CSANT96.HTML

1st homebrew on 144, 1st overall on 220, 1st 2nd and 4th overall on 432.
The first place antenna on 432 was not usable under any normal
circumstances, and was physically a kludge. 1st on 144 and 4th on 432
were meant to be in a 2x2 array, but work adequately alone.

Aw common David,
you are much to demanding of notification of other peoples efforts
You are positioning yourself as a judge in these matters yet have
declared no credentials On my antenna I have yet to have a qso with
it. Why ? Because it is my hobby and not to impress others such as
you.When I get my interest back I will go on the air like I did before
my elmer passed,G3IGP. I stopped when I took down my 80 foot boom yagi
with 13 elements made of foil covered fishing poles and now just
experiment and use the laptop

Aw come on Cecil
It is a lumped load which is unbalanced and Maxwell demands
equilibrium ie balanced. Yes, it has distributed loading but formed
into a helix antenna
such that it includes lumped loading. Maxwell in his search for
maximum efficiency he would have added a symbol to his equations for
lumped loads . He then would have to include pitch and the like but he
just did not consider it as a consideration.
This is clearly shown with a WL verticle when for maximum effeiciency
it is tipped from right angles to the Earth ala the Corriolis effect
with which you are tampering with
when current rotates, and its introduction of a slow wave and a
different velocity factor
This is why you cannot equate lumped loads with antenna degrees, only
approximate
I have no which to debate it so I will leave it at that. Soon I will
be heading home.
No offense intended but physics is physics

lumped loads like capacitors and inductors are indeed included in maxwell's equations, its just a matter of scale. the problem is that most modeling programs can't handle the large scale variation needed to go from a large radiator down to a small coil and still maintain the segments properly. but indeed the fields from and within the lumped elements do follow maxwell's equations.

>This is clearly shown with a WL verticle when for maximum effeiciency
>it is tipped from right angles to the Earth ala the Corriolis effect

art is a bit tipped from vertical also, but i doubt if it is a corriolis problem.

Hi Art,
Can you reference a professional journal that confirms this Coriolis (I
believe that is the correct spelling) effect w/ respect to tipped
verticals - or is this something only you have discovered?

thats one of art's discoveries. though it started out as being because of
the weak force instead of the coriolis effect, i think coriolis is probably
more believable... but do you have to tip them different in the north vs
south hemispheres? and what happens at the poles and equator, are they
straight up or horizontal??

Coriolis effect is already well accepted in science.
A tipped radiator comes about when one uses optimizer style programs
based on the teaching or equations of Maxwell which accounts for ALL
forces involved within an arbitrary border ie equilibrium per the
teachings of Newton. Most people ignore the tipping arrangement for
simplicity and use programs strictly for planar forms which is an good
approximation in accounting for all generated radiation

Yes you are correct David. Coriolis effect is well known where as the
weak force is not
because of resistance to change. The Coriolis effect can be observed
by looking in the toilet bowl in the different parts of our Earth.
Whether the change over effect observations alignes with the equator I
do not know as I am now home in Illinois and have no wish to travel
more today
. As for reference in professional papers take note of equations for
displacement current as stated by Maxwell which I refer to as "the
weak force" that Einstein spent so much time in looking for without
success. This force is one of the four forces alluded to in The
Standard Model of physics

oh, so the displacement 'current' is now the weak 'force'... please explain
how those units match up, and also how the observed range of the weak force
coincides with the wide ranging effects of the displacement current.
.

... but since you've built a small antenna and it's working, you may have options for _placement_ that will enhance your reception further. It may work better at one east-facing window than another and it may work best at a particular height off the floor at that "better window." (Outside TV antennas are sometimes installed after one guy walks the roof with the antenna on a stick, while somebody else monitors the signal; the antenna is finally mounted when they pick the "sweet spot," like on a tennis racket.)

Adding coaxial cable usually reduces the signal, but if your "better window" only requires a smidgeon more of coax, maybe you should try it.

On my antenna I have yet to have a qso with
it. Why ? Because it is my hobby and not to impress others such as
you.When I get my interest back I will go on the air like I did before
my elmer passed,G3IGP. I stopped when I took down my 80 foot boom yagi
with 13 elements made of foil covered fishing poles and now just
experiment and use the laptop.
==========

I looked for this and related postings at rec.fishing.amateur.poles but came
up empty. Strange.

(Did find one guy who tries calling CQ into his tackle box.)

Maybe this gets to Faraday Rotation? The Coriolis Effect is on particles,
not waves, right? EM waves have no mass.

not art's waves, they are made up of magical levitating diamagnetic
neutrinos that jump off antennas when you pass a current through them.

You really enjoy playing the simple person. You don't find the weak
force as believable but do find Coriolis effect believable so I gave
you what you desire,
something to believe in. The basic level of time in physics is based
on the speed for a capaciter to release all its energy which is then
replaced by a magnetic field. In other words time refers to the time a
magnetic field is formed by one of the standard models
forces. When a you have a tank circuit a symbol of resonance, the
energy created by the magnetic field is really the effect of that
energy called displacement current which flow in a circular motion at
and below the maximum diameter of the radiator.
This force provides an elevating force to unbound particles at rest on
a diamagnetic surface which meets the definition of a accellerated
charge. The speed of this particle is the energy applied on impact
during the formation of the magnetic field or energy release from a
capacitor. As the unbound electron constitutes the unbound particle
the energy is enough to project the particle with spin where gravity
does not have a measured effect on it's trajectory. Gravity is the
weakest force known despite it's name and the unbound electron is
considered the physical smallest mass that exists in the Universe.
So David you have the answer as to what the "weak force" is and what
energy it contains in measurable terms that it imparts to a particle.
This IS included in Maxwell's laws where there is the reference to
time. Physics is physics.
David, I am getting very close to plonking you as you show no
indication of benefit from the answers you demand of me and others.
Art

There is nothing without mass. Radiation is created by an
accelleration of charge which is mass. Particles create radiation .
Waves is also mass that is soluble acting under the influences of the
Universe.Thus a wave is a adjective that describes the applied
actions upon mass ie a noun. If a particle sits on the formation of a
wave then the two part ways.

LOL I just built the thing out of boredom and the effects of having a
really nasty cold. It was obvious that the only radiation to speak of
was coming from the coax. I actually heard some pretty strong signals
on 11M with it. They were also very non-directional . When I shorted
the ends of the feedline together and connected it to my tuner it may
actually be mistaken for a viable antenna working about as well as 20
or 30 ft of wire hanging out the window hearing signals on 80 40 20
and 11. It wouldnt suprise me if Art never even built the thing.

I don't have any east facing windows. I did take the antenna outside
and put it up on a pole. Just as an experiment. I was not able to
get much better performance. But it was only 6 or 7 feet high.
I supose I could add another element. It would be a cheap enough
experiment. Eliminating the coax is a real possibility.

Thanks for the replies, Dave, Rick, and Jim. Since my ideas didn't go over so well, perhaps it's best to just describe my setup and then listen to any suggestions. Since I'm not an electrical engineer, do try to keep things simple.

As I said earlier, the radio and speaker are both connected to the house ground through their power cords. I've also installed an inverted V dipole in the back yard (the only place it will fit). The center (feedpoint) of the antenna is attached to the roof on the second floor (about twenty feet above the ground) and the two ends run out to the two corners of the backyard. That's the best I can accomplish given local antenna restrictions.

My house is located on a hill with a top floor entrance and living area. Below that is another floor level with the backyard, with a basement below that.

The radio will be located in the living room on the top floor, again one floor above the backyard. The coax (RG-8X) will run out a window on the second floor to the center (feedpoint) of the antenna attached to the roof just outside (a run of roughly 15-ft).

Now, where (if any) should I add grounding to that setup? I was going to add a lightning arrester to the coax just before it enters the house (fed into two ground rods), but will forego that since none seem overly thrilled about the idea.

By the way, a Yeasu technician once recommended salting ground rods to resolve a poor grounding situation at the time, so I've been doing that ever since (can't hurt), especially during the dry summer months. Adding water is pretty obvious, so didn't think I needed to spell that out, Dave.

Electrically, yes. Its velocity factor calculates
out to be about 0.02 at 4 MHz and it is physically
0.563 feet long. 0.563'/0.02 = ~28 feet.

At 4 MHz, a 75m Texas Bugcatcher coil replaces ~28 feet
of wire in the antenna. That is ~41 degrees at 4 MHz.
(Note there is about 44 feet of wire in a 75m Texas
Bugcatcher loading coil.)

Equation 32 in the following IEEE paper is what I used
to calculate the velocity factor of the loading coil.

In part II of the said Corum paper it clearly states that there is no rigourous solution to helicals supplied by Maxwells laws. If this is the case I suspect that Corum made some approximations. This is the point that I am making with respect to Maxwell's law's and lumped loads.

Do you have metal water pipes upstairs with continuity to a spot near the ground rods downstairs? If so you can run a strap to your shack upstairs, and another from the water pipe to the ground rods downstairs.

You need an RF ground (as the safety ground is the 3 prong Edison.) MFJ makes an artificial ground. Do you use a balun at the antenna feedpoint? How do you tune the inverted-V?

Using your argument, I could buy an inductor wound on a toroid core and
claim it is a "distributed" component because it "electrically" replaces
some calculated "degrees" or "feet" of wire at some frequency.

You appear to be trying to make lumped components into distributed
components to suit your arguments. Shame on you.

John

That's fine.

Where are you located? The recommendation will vary substantially if
you are in Southern California (almost no lightning) or Orlando Florida
(Lightning capital of the US, for all intents and purposes).

The electrical code requires some sort of antenna discharge unit, but to
be honest, most ham antenna installations aren't code compliant. BUT,
if you want to do a half measure of some sort, do what is done for cable
TV and satellite dishes. Put a grounding block at the entrance, and at
least make sure the shield is connected to ground. The grounding block
should be connected to the house's bonding system by a reasonably direct
connection with a single conductor. Get a copy of the "Low Voltage
Handbook" from Mike Holt (it's a free download from
http://www.mikeholt.com/) and it goes over all this kind of stuff.

Hook up a coax switch so that you can disconnect the radio and short the coax when you're not using it.

Is the radio AC powered, or is it DC powered, and the power supply is grounded with the third prong?

>

Hmm. and that Yaesu technician has what training and experience in grounding systems for lightning protection (other than what's printed in the front of the manuals)?

And did the salting improve anything? if so, what? adding grounding is almost always the wrong solution to operational problems (RFI, for instance), since the purpose of grounding systems is to deal with abnormal events (short circuits, transients, etc.)

If you've got RFI issues, you need to read the Jim Brown (K9YC) writeup on RFI, before you start hammering in ground rods and sowing the fields with salt. http://www.audiosystemsgroup.com/RFI-Ham.pdf

bad plan.

1) Water pipes may or may not have good electrical conductivity.
2) You're asking for leakage current to flow in the pipes: corrosion is
one possibility, shocks to people touching the pipes or plumbing is another.
3) If you also have the third wire ground to chassis, good chance you've
now created a big receiving loop consisting of the pipes and your house
electrical systems. Not good.

4) Using plumbing systems for electrical safety bonding/grounding is not
recommended in any of the recent editions of the electrical code, and is
certainly not a good idea for RF currents.

>
> You need an RF ground (as the safety ground is the 3 prong Edison.) MFJ
> makes an artificial ground.

If it's a coax fed antenna, there should be no need for any sort of RF
ground in the shack.

Do you use a balun at the antenna
> feedpoint? How do you tune the inverted-V?

Good RF chokes on the coax at the feedpoint and at the point of entry
would go a long way to eliminating any "RF in the shack" problems. A
couple 2.4" 31 mix cores with half a dozen turns on them, for instance.

Whether the V is tuned or not won't have any effect on RFI or grounding.

Of course, they are approximations. The wire
diameter doesn't even appear in the equation.
Quoting the Corum paper:

"A useful engineering *approximation* has
been found for the fundamental resonance of
helices ...".

"... an *approximation* for M has been determined
by Kandoian and Sichak which is appropriate for
quarter-wave resonance ... for helices with
diameters considerably less than a free-space
wavelength".

"We have found that this expression gives acceptable
results (errors less than 10%) for most practical
applications that involve wave propagation on
helical resonators ...".

Hi John,

All the right words are there. They are expressed in a familiar
order. There is the *implication by special marking* that can be used
equally as a point of reversed qualification - the back exit.

So, in retrospect (a very short one of the six lines above), this is
obviously a problem of you don't understand what you were thinking
when you asked your question. Unfortunately, you could have as easily
agreed only to have Cecil point out, through the same chain of
discussion above, you are wrong - you don't understand what you were
thinking.

Sorry, that's not true. Toroidal inductors are not covered
by my argument adopted from Dr. Corum's IEEE paper. Toroidal
inductors are not being discussed at all - except by people
afraid to discuss large air-core loading coils. My argument
(based on Dr. Corum's assertions) apply *only* to large,
air-core coils that meet the conditions listed on page 4 of
Dr. Corum's paper at:

http://www.ttr.com/TELSIKS2001-MASTER-1.pdf

A 75m Texas Bugcatcher coil is an example of the type
of air-core loading coil that I am talking about. It's
about 6" diameter, 4 tpi, and 6.75" long. Dr. Corum's
equations indicate a VF of ~0.02 for such a coil used
on 4 MHz which makes it electrically about 28 degrees
long.

> You appear to be trying to make lumped components into distributed
> components to suit your arguments. Shame on you.

No, just the opposite. I am trying to keep others
from considering large air-core distributed network
loading coils to be lumped components (which they
obviously are not). Dr. Corum says any coil electrically
longer than 15 degrees (0.04WL) needs to be treated
as a distrubuted network, not as a lumped-circuit.

Here are some of Dr. Corum's class notes:

http://www.ttr.com/corum/index.htm

Here's a quote: "In the following note, we will show
why one needs transmission line analysis (or Maxwell's
equations) to model these electrically distributed
structures. Lumped circuit theory fails because it's
a *theory* whose presuppositions are inadequate. Every
EE in the world was warned of this in their first
sophomore circuits course."

Yet W8JI reports a 3 nS delay through a 100 turn, 10"
long, 2" dia loading coil on 4 MHz, an obvious
impossibility since such a large, long air-core inductor

is nowhere near to being a lumped-inductor. At ~37 degrees, based on Dr. Corum's equations, it is more than double the 15 degrees that is the point at which the lumped-circuit model starts to fail.

37 degrees gives a delay of ~25 nS on 4 MHz. That's approximately what one would measure if one used a traveling wave for the measurement instead of a standing wave (which doesn't change phase with distance). W8JI's "measurements" were off by almost a magnitude.

Hi Stewart,

A very good description of your set-up. You are already grounded through a the haphazard path of your AC outlet - if you chose to use three prong connections, if your outlet is in fact grounded, if your equipment actually has a safety ground to chassis. A lot of "ifs," hence my use of "haphazard."

By deliberately adding a ground wire going to an ad-hoc ground rod, you can easily introduce problems. The worst of which could be lethal, but that extreme is unlikely (except it might only be resolved at the coroner's inquest).

Consult code for grounding requirements.

The minor problems include ground loops that can plague your listening and/or your contacts asking what that strange music is in the background of your transmission. The loops can burn out wiring in your rig (actually, more like traces on cards). The oddities that arise from ad-hoc grounding scroll out on a list of complaints that many come here to find solution for.

>By the way, a Yeasu technician once recommended salting ground rods to

That sounds like a fantasy. If this thread doesn't grow suitably to fill in the vacuum of information, you can do a search in google groups, for this group, using the key word GROUND and CODE.

Cecil you never once backed me up on Maxwell/lumped loads
saga on this group. Now you point to several improvisations on
obtaining
lumped load affects by other avenues where not one theory satisfies
the physics community. If one starts off with the acceptance of errors
in the range of 10 % where you are also allowed to jump from one
theory to another so the acceptable discrepancy can be satisfied then
this is dishonest with respect to physics.
As I have pointed out many times, Maxwell's laws do not pass rigourous
examination when lumped loads are introduced. With that said, I do not
quarrel your aproach with respect to degrees of antenna in terms of
approximations but when it is applied to antennas on this group
adherence to Maxwell is required, which is inclusiveness of all forces
as opposed to planar designs (yagi's) where liberties are taken in not
accounting for all forces within the arbitrary borders. It is this
very aproach which have allowed designs of antennas to move away from
the edicts of Maxwell and the equilibrium requirements of Newton which
provide for maximum efficiency.
It is the silence of you and other respected people on this group that

is responsible for the lack of advancement in antenna design over the last hundred years by not adhering to classical physics.
Nothing personal intended, but this does exhibit a representation of the engineers in this group in misleading other hams with respect to this hobby.
Best regards
Art

It could be worse, John. He could claim that his loading coil replaces
a certain amount of period (time) in addition to length. That might be
too complex for him, though.

Hold on guys before you start to pile on. Now there is agreement
with respect to approximations, the original debate did not go away.
As Cecil pointed out the difference is in the order of a magnitude!
Somebody has some explanations to provide such as instruments used
were not calibrated as perfect as Richard demands which is why he
agrees with nobody.
Somebody is hiding from the truth and using a sprinkling of untruth to
cover their path.
It is either Roy and Tom or Cecil himself. All others follow their
role models lead.

The percentage of a wavelength that the loading coil
electrically occupies is directly related to the delay
in time through the loading coil.

At 4 MHz, 36 degrees (0.1 WL) of loading coil equates
to 25 nS of delay through the loading coil.

Roy's and Tom's blunder was to think one could use the phase
of the current on a standing wave antenna to determine the
delay through a loading coil when the phase of that current
doesn't change with length even in the wire sections of the
antenna.

Hint: The phase of the current on a standing wave antenna
cannot even be used to determine the delay through a wire
(proved by EZNEC) since the phase doesn't change with
length (over 90 degrees of length).

Since the phase of standing wave current cannot be used on
a wire, why would anyone be naive enough to think it can be
used on a loading coil?

I was just quoting the standard model. Photons indeed
do have mass since they are always traveling at the speed
of light through a medium. If a photon ever slows down to
zero, that's when its mass goes to zero. No particle with
a non-zero rest mass can ever travel at the speed of light.

I never, never said that "energy does not require mass"!

What I said was that ZERO energy does not require mass.

HMMmm
The big bang started with energy being supplied to mass at zero
temperature
What supplied that energy has not been determined but it was energy
provided to mass, possibly hydrogen since it is first on an element
list, that propelled the parts of the broken initial mass. The initial
energy can only be provided back per Newtons laws is by all mass
returning to the initial point of rest. Therefore since a boundary was
formed around every piece of mass that was emitted since it generated
its own environment it is impossible for all boundaries to return to
the original point as the environments generated within each boundary
fills all the space around the original point of action. Thus unless
all boundaries decay to nothing, which means all energy now be zero,
it still leaves us with the initial mass to be accounted for that was
the carrier of the initially supplied energy! In other words the
initial energy supplied for the big bang can only return to the
initial point of the universe to achieve accountability of all forces.
I have a feeling that scientists today are getting close to assigning
different
names to the same parts by viewing the same but from different vantage
points ie a cluster of particles having a different name to that of
its parts.

It's called "The Big Crunch", Art, and is the theory
to which I personally ascribe. I'm trying to live
long enough to see it happen. :-)

I believe the universal expansion from the Big Bang
will someday reverse itself and collapse back into
the singularity from which it came. It's called
"The Oscillating Universe", a book I read half a
century ago about the time I graduated from Texas A&M.

How can you live to see it happen when it requires our Earth to be
concentrated as a single point mass at what was our Earth center of
gravity! Only when all boundaries shrink to point mass will they all
be able to elbow themselves back to a single point at the point of
origin. You can't see a black hole if you are drawn in also!

It really depends on the area that your trying to build the RF Ground
on, or into. Here in Alaska much of the earth (Dirt) is just plain
Silica Sand, and rock, with very little mineralite in it, and is about
as effective an RF Ground as a piece of Glass. We use Dipoles a lot just
for that reason as they don't required an RF Ground to work against to
radiate effectively. In some areas where Marconi type Antennas are used,
and one MUST have an effective RF Ground, we have used Chicken Wire
panels laid flat out from the base to 1/4 Wave at the lowest Frequency
of intended use, and then Salted the dirt to add to the effective
conductance of the Ground plane untill the chicken wire Rusts to the
point of leaving just the conductive material in the top of the dirt.
The Commercial AutoTune Antenna Tuners really don't work well without an
effective RF Ground to work against, as the Microcode that runs them,
can't deal with the very non-stable RF Grounding Systems. There are a
number of ways to get single-ended Autotuners to tune Balanced Dipole
type Antennas, and those are used as well. Much of the work done in the
commercial MF/HF Communications Antennas Systems here in Alaska, was
pioneered by the Engineering Staffs of the old Northern Radio Company,
and then continued by Stephens Engineering Associates. (SEA) Both
outfits were leaders in Bush Communications here in Alaska, in their day.

For what? If the antenna system is balanced (as are dipoles, inherently), I seriously doubt a balun would be good for anything.

He's feeding it with coax, so it's not just a good idea, it's required.

The antenna is balanced, the feedline is not. He stated the feedline is
RG-8X.

> transients, etc.).

I will have to second Jim's statements here. Anyone that thinks that salting ground rods will provide a better radio frequency ground is fooling himself. Charged ions in water move at relatively slow speeds that are determined by, among other things, the temperature, the size of the ions, and the viscosity of the solution. At low frequencies, the period of the AC voltage allows the ions to migrate a considerable distance. But at higher frequencies, the period becomes shorter and the ions can move only slight distances before the polarity, and hence the direction of the ion migration, changes. The conductivity of the solution follows a reciprocal relationship with frequency.

By the time we get to radio frequencies, the dissolved salts do little to increase the ground conductivity. What is important, however, is the moisture content. This is why moisture retaining clays such as bentonite are sometimes used.

In areas where the ground is frozen. it is difficult to get a good radio frequency ground. This is because the dielectric constant of ice is low while that of water is high. In this special case, adding salt might help as it lowers the freezing point of water.

At the WYFF transmitter site on Caesar's Head, SC, there is an 800 foot tower atop a 3100 foot granite mountain. To get a decent ground for lightning protection, they ran three 1/4" thick copper sheets about a foot wide out from the base of the tower to where the guy wires attached. This provides an effective capacitive grounding system as the granite itself is not very conductive. They get hit by lightning frequently. Previous station engineers have related many stories about ball lightning rolling around the floor in the transmitter room.

I know that, and just because it's balanced to unbalanced, it's not *required.* The antenna system can work just fine without one. In some cases, at least according to the late Lew McCoy, it can do more harm than good. If the antenna system is inherently unbalanced due to one leg being, say, in greater proximity to metal and other objects, then I would consider using some kind of balun or choke system.

Nope, nothing anywhere near the radio. All the water pipes in the house are on the opposite side, fifty feet or more from the radio. The shortest path to any ground whatsoever is directly out the window and down to the soil roughly ten feet below.

> You need an RF ground (as the safety ground is the 3 prong Edison.)

Nothing is permanently installed at the moment, so it's a fairly clean slate. The antenna (Alpha Delta Model DX-EE 40-20-15-10 meter dipole) was pre-installed to drill the hooks needed to hold it up, but it's now a pile of wires on the living room floor. The antenna doesn't have a balun of any type.

While the antenna was up, I used an MFJ-207 Antenna/SWR Analyzer to get some very quick readings just to make sure the antenna would work.

Heidelberg, located in central Germany. Lightning is not a huge problem here, but one can perhaps never be too safe in that regard.

By the way, the soil here is just fine as well and certainly doesn't lack moisture. Thus, since so many are fosusing on it, I'm sorry the salt was even mentioned. It's not needed in any way. It's just something I've gotten into the habit of doing.

> Hmm. and that Yaesu technician has what training and

> (short circuits, transients, etc.)

The salt did indeed help in that particular situation. At the time, I was living on a hillside in Bremerton Washington, with the immediate countryside mostly small rock incapable of holding water for any length of time.

The situation was so bad, my radio (Yaesu FT-847) would often instantly shut off due to high SWR readings, in spite of my ground plane antenna being fully functional with several (at one point eight) ground rods installed. The only way to prevent that was to add water around the ground rods each day, which usually worked only until the next day.

Since adding more ground rods did nothing (and watering my antenna each day was quickly getting tedious), I called Yaesu thinking the radio might be defective. The technician recommended salt after agreeing my ground rods should be sufficient for the task.

I was skeptical, but did as he suggested. Dug a hole (about a foot deep) around each ground rod, drove the rods in a bit deaper, poured in a generous helping of rock salt, and then watered the area long enough for the salt to spread into the soil.

Of course, the radio was fine immediately after adding the water, but the real test was the next day once the water drained away. The radio did operate just fine that next day, and the day after that. In fact, the rock salt added to the soil (more added every two to three months) resolved the problem entirely the remainder of my time at that location.

Okay, I have checked each of those. The house was recently inspected
ensure compliance with recent building code requirements, with the
outlets and overall grounding system checked for proper wiring at that
time. The house wiring exceeded current building requirements, which I
was indeed happy to hear.

The radio uses a three-prong cord (a requirement here), with the
chassis apparently connected at several points to the ground of that.
It appears the antenna shield side of the connector is also bolted
directly to that chassis.

Balun/choke.. tomato, tomato.. they're really all the same thing. Keep
the RF off the outside of the coax.

>
> Since we are sticklers for the NEC, Homey needs a #6 wire from where the
> transmission line enters the dwelling to an 8' copper clad rod driven
> into the earth, as close as practicable.

The communications system (be it CATV, net powered broadband, amateur,
etc.) would need to be bonded to any of the usual things that form the
grounding/bonding system,e.g, one could "ground" through the metal conduit.

A ground rod is, of course, not recommended in the current codes as a
made electrode, and in any case, the code doesn't necessarily require a
specially installed ground for this purpose. If you DO install another
ground, then it has to be bonded with AWG #6 copper (or bigger) (can't
use the conduit)

Telephone has different rules. Must have electrode/grounding means as
close as practicible to point of entrance, and the ground wire has to be
AWG14 or large, insulated, in as straight a line as possible.

Metal structure supporting outdoor antenna systems have to be grounded
with AWG10 or bigger copper, AWG8 aluminum, or AWG17 copperclad steel,
straight line. (the size requirement is for mechanical strength, not
conductivity, which is why the copperweld(r) can be smaller)

So you have these weird situations where the phone protection block has
to be connected with AWG14 insulated to a grounding electrode as close
as practicible, but then, because of the "bonding of electrodes" rules,
you have to connect that electrode to the "house ground" with nothing

smaller than AWG6.

CATV is even different.. grounding block for drop has to be grounded to an electrode close to block and an *insulated* AWG14 or bigger run to bond with the rest of the house's grounding system.

This sort of thing is why most ham installations aren't "code compliant"... heck, you could go insane trying to wend your way through the thicket of rules for the NEC. And that doesn't even begin to get into the transient suppression guidelines and/or NFPA 780 lightning protection rules.

Most every practical dipole installation has some imbalance in the
installation (the trees are closer to one side than the other, etc.).. a
choke to prevent RF current from flowing on the outside of the feedline
will at least make the pattern more consistent with expectations.
Might make the tuning less "twitchy" too (because you've decoupled the
effect of things near the feedline).

Certainly, a choke at the entrance to the shack is a great way to keep
RF outside.

The NEC cares not one whit for RF performance. The NEC rules are designed to keep the house from burning down or people dying if something happens: like a power line falling on the antenna. I read a quoted statistic (for which I can't find the original source, so it might not be trustable) that electrocution is the leading cause of death in connection with antennas.

The professionals use something like bentonite or montmorillion clay (kitty litter) as a soil admixture. The stuff is like a sponge and holds the water real well (by surface tension) and is very ionic as well, so the conductivity is good. You have to be careful, because too much causes an expansive soil problem.

Hi Steve,

So, in fact your three prong plugs find their way to the panel ground.
Can YOU find that ground?

>
>The radio uses a three-prong cord (a requirement here), with the
>chassis apparently connected at several points to the ground of that.
>It appears the antenna shield side of the connector is also bolted

So, by this explicit statement, your "balanced" antenna has been
unbalanced at the rig (which only further enforces the unbalance by
virtue of the coax connection).

>> By deliberately adding a ground wire going to an ad-hoc
>> ground rod, you can easily introduce problems. (snip)
>
>
>So you recommend no additional grounding?

This is a loaded question because there are TWO grounds which
discussion often gets mixed. They may both go to the same point of
zero potential, but their paths are what distinguish them. The TWO
grounds are safety ground and RF ground. Any wire that is
significantly long at a wavelength of your operation, will qualify
more as a radiator than it will as a ground wire.

Consider you are sitting at your transmitter, it has a dedicated newly
applied ground wire that runs the shortest distance to what you think

of as ground. Maybe that is all of 10 feet. You are operating on 10M. Ground is a quarterwave away. That puts your equipment at the high potential end of a wire with zero potential at ground. How grounded does that sound?

The solution there is to add an artificial ground tuner to move that potential away from you (this would be an attempt to "balance" the distribution so that your equipment sits at an artificially imposed neutral - ground of another mother).

Thing is, as I said, you already have a ground connection. The safety ground is a necessity unless you are very practiced in the art of isolation. You can add another path, and, again, that path may be a different length to the one you already have. Given that situation, you may find one path now spilling current into the new one - as dependant upon the wavelength of operation and the physical path lengths. When this spilling from one path into the other occurs, strange things happen compared to if you hadn't added that new path.

More's to be said, but that's enough for now.

Worse than that. You've basically made a big loop antenna: greenwire
ground to panel, panel to ground rod, ground rod to rig.

>
> The solution there is to add an artificial ground tuner to move that

Or, easier.. put a choke around the feedline where it comes into the
shack, so that there's no appreciable RF current through the chassis and
green-wire ground.

Exactly.. one DC/Line frequency path is all that's needed for safety.

Since the curves are generated from the equation,
they should match perfectly. As a matter of fact,
I have a dot on that graph at 0.004 and 5k. The
VF is ~0.02.

Dear list-

I was just wondering about the performance of a long wire dangled over a cliff? Our Field Day location is on the Mogollon Rim (http://en.wikipedia.org/wiki/Mogollon_Rim) of Northern Arizona. We really like the view, but I was wondering if it might not be useful for antenna experimentation, too.

My thought is to use a fiberglass pole at a 45deg angle to hold a weighted antenna line off from the cliff face, although some locations even have pretty good overhangs. Then we could use either an inverted-L configuration, running feedline along the support pole and bringing the horizontal part up to a tree near the edge, or just go with a really long end-fed antenna.

Any thoughts on this? I couldn't find anything written about this via google. All constructive comments are welcomed.

Hi Ross,

Put a good weight on it, and spool out over the edge until you achieve
lowest SWR for your frequency. The higher the cliff, the lower the
frequency you can accomodate. Think of it as an inverse balloon or -
a Lead Zepp.

What are you going to do about ground?

I have a question for the antenna gurus. I have a 40m groundplane (base about 10 feet up, sloping radials). It works fine on 40 and gives a reasonable swr on 15, although, I'm sure, too much high angle radiation. What would happen if I put a 15m gp element in parallel with the 40m? Or (I suspect) would it be better to parallel the15m element with my separate 20m gp and (if the sunspots ever come back) parallel the 40m element with a 10m element. I'd rather not put up 4 separate gp's (for family reasons). TNX W0BF

its all a question of scale... your lumped inductor looks distributed to me
under a microscope, and still obeys all of maxwell's equations.

so now you can define time in terms of time, sounds like another circular argument to me. it takes time to discharge and that defines time... why doesn't the time it takes to rotate the earth define time? that is more sensible and has been known to man for much longer than discharging capacitors.

How might this happen? The choke's not in the desired RF path (i.e. the
inside of the coax and the antenna itself)

Putting an RF impedance of, say, 5K in series with the current on the
OUTSIDE of the shield should effectively reduce the current to zero, so
there's no power being dissipated in the choke.

Yes, if you use a choke with too low an impedance, it might dissipate power.

The assembly instructions for the antenna say...

The antenna is "..designed to be used with
50 ohm coax cable. No balun is required for
proper operation.

If RF on the coax is a problem, simply wind
a "choke balun" with the coax that's used for
your feedline. Wind approx 8 turns, at about
an 8 inch diameter and tape (with outdoor rated
black electrical tape), like a donut, and place
this "donut" near the feedpoint of the antenna.
You should leave about 2 foot of your coax
sticking out of this "donut" for connection to
the antenna. Then attach the end of your
coax to the antenna connector on the center
insulator, with the coax connector that is
already on your feed line."

In other words, a scramble-winding choke near the antenna's feedpoint,
which I'll add if RF becomes an issue. As stated in my first message
("don't believe RF is an issue with a dipole," which should probably
read "major issue"), I'm much more concerned with safety and lightning
protection.

Okay, I'm adding a balun. Now the question is what and where. The
assembly instructions for the antenna say...

The antenna is "..designed to be used with
50 ohm coax cable. No balun is required for
proper operation.

If RF on the coax is a problem, simply wind
a "choke balun" with the coax that's used for
your feedline. Wind approx 8 turns, at about
an 8 inch diameter and tape (with outdoor rated
black electrical tape), like a donut, and place

You should leave about 2 foot of your coax
sticking out of this "donut" for connection to
the antenna. Then attach the end of your
coax to the antenna connector on the center
insulator, with the coax connector that is
already on your feed line."

In other words, a scramble-winding choke near the antenna's feedpoint.
The alternative is an MFJ-915 in-line balun with 50 ferrite core beads
on coax (cheaper than I can buy the ferrites), which MFJ says should
be installed closer to the radio (3 feet) as opposed to the antenna
feedpoint at the other end of the coax as described above.

Which of the two options is most sufficient for the task and which is
the correct placement for this - or are they both right depending on
the type?

Hi Stewart,

The answer to that is driven by the perceived problem. In a nutshell,
if you don't have a problem, you don't need the balun (or choke).

Knowing that you have a problem is another matter; but if you don't
know what the problem is (the perception), you wouldn't know if it got
fixed either.

Read Jim Brown's RFI-Ham.pdf referenced in an earlier post.

"choke baluns" made by winding coax are pretty much single band devices.

A better approach is a single 2.4" toroid of suitable mix (#31 is good),
and put a dozen turns of your RG-8x on it. Put one at the feedpoint,
put one where it comes in the shack. Buy some extra cores because they

make good RF filters for things like power cords (and the hole is big enough that a standard IEC power connector will fit through them)

The MFJ915 is fine, although I wasn't able to find any actual performance specifications or details of what mix they're using. (in a few minutes of casual googling).. MFJs is probably an incarnation of the "W2DU balun", so the data Jim measured is probably reasonable. (about 1500ohms peaking at 10MHz)

I think you'll get better results (cheaper) with the single big toroid..5 turns gives you more impedance than the W2DU, and it goes up from there (based on the measurements in K9YCs paper.. page 12). The toroids run about $5. Most of the gain is from using a better mix (31)

I don't understand your question. The radio chassis is grounded to the wall outlet. The overall house wiring was recently inspected, with the grounding checked at that time. It was a thorough inspection which also included a device plugged into most outlets to check the wiring. Given that, I don't really know what I'm supposed to find and why.

> So, by this explicit statement, your "balanced" antenna
> has been unbalanced at the rig (which only further enforces

I guess so. Actually, I don't really know. The radio was manufactured with the chassis grounded to the wall outlet and the antenna was designed by it's manufacturer to work properly with 50 ohm coax feed connected (I would assume) to a radio like this. What impact that has on balanced versus unbalanced is beyond me, and the same is true for what exactly you want me to do about it.

Wow, your messages get more cryptic as they go along. I thought the very first message made it clear I'm not trying to fix a specific problem, but instead trying to head off some of the more common problems associated with a setup like this.

Again, this is an entirely a new setup which has not been installed yet. What I'm seeking here is some input on the best way to do that. I'm fairly familiar with the basics of dipole antennas, but hoping for some solid advice from those with a lot more experience than my own.

Because the magnetic field produced launches the particle which
travels at the speed of light by impact. This is the basic metric of
time. A particle emits light when it's momentum changes. Particles
carry just one color which is a measure of its frequency. There are
only three colors available but together they form the basics of all
colours. Colors emitted can be seen in the Northern lights as the
momentum changes of particles entering the Earth's medium where they
come to rest as unbound electrons on diamagnetic surfaces.

What if you use a coax with two shields, one shield for chassis ground
which is the coax connection and the outer shield for earth/ground?
Yes, there could be a ground loop but the nearest ground to a strike/
antenna is probably the best protection

>yet.

Grounding has been covered, but, likely as not, you will have more problems there than anything over the air.

As for antennas, I've read the advice offered to you by MFJ. Belts and suspenders kind of stuff, but that is the level of advice you can expect until you discover something wrong. Do everything suggested, and then do it again at different places. [Cryptic as it seems, eventually this lesson will emerge from the reams of advice.]

You ask to prevent problems and I have pointed out they are only problems if you think (or get burnt when) they are. A bajillion operators live lives of happy operation with none of those "solutions" in place. Fix their "problems" and likely as not, nothing will get noticeably better, could eliminate some former contacts, and only make them grumpy about engineers crimping their fun.

Hi Stewart,

If you are going to add a ground, it has to go to the ground electrode - it is called service ground. That is located in very close proximity to the fuse box - it is called the service panel. Close inspection (by you) should reveal it. It may be a wire tied to a cold water feed from the city services.

>on balanced versus unbalanced is beyond me, and the same is true for
>what exactly you want me to do about it.

A purist's balanced antenna is connected to a twin lead, or open wire pair. This transmission line goes to the purist's special tuner with a balanced connection. Many cheap tuners pretend to offer this option. Expensive tuners the purists use pretend to do it too. At some point, one of those two wires (if you were using twin lead) would go to the chassis. This would make it unbalanced, and this unbalance would be cast back into the antenna making it unbalanced. There are tuners that do it right, but you have to look under the hood and verify their claims.

Using a coax means you are using a conventional connector with a collar (bayonet style or screw type) that connects directly to the chassis. BINGO! Your system is unbalanced. But it was unbalanced before it got there, and the connection only enforced it. The coax offers what is called the "third wire" to the dipole with its shield

(the shield exterior is a separate circuit to its interior circuit). When you use a coax with a dipole, you are making it a tripole, with one leg of indeterminate length. You can reduce the third circuit path effect through choking.

If you cared about the state of balance, then you can take steps to reachieve balance. One is to choke the feed point at the antenna, and then choke it again a quarter wave down from that point. You can (as suggested by Jim) choke the ground as well. You can (as suggested by MFJ) choke the transmitter end of the coax. Each brings an additional degree of isolation, and attempts to bring balance. Unfortunately, balance is also a function of what physical distance and bulk relations each arm of the antenna sees. Nature and homes rarely exist with perfect symmetry (another name for balance) to serve an antenna.

You could add a chimney stack to the other end of the house, and rearrange furniture (and occupants) inside to help, but life is short. Got trees? If you are operating 80 meters, anything within 100 feet is fair game for the balance sheet.

As for impact, there is every chance you don't need to do anything but insure a good safety ground. If your chassis bites you during transmission, then, yes, add some chokes (see thread). If your antenna picks up signals from directions you had pointed the antenna away from, then, yes, add some chokes (see thread). If you cannot tune the antenna on some bands, maybe (just maybe), add some chokes (see thread).

Well, I'm not going to argue with someone who thinks that placing a
balun between an unbalanced feed and a balanced load could ever possibly
do more harm than good.

It would be a utter waste of time.

Ive done that with the bottom half of a dipole hanging off a bridge.
This put the bottom end of the 40m dipole about 100ft off the ground.

Matching issues aside, common thinking on the balun issue is that it greatly attenuates current on the outside of the coax.

In certain rare cases, I suppose such current could be a good thing, giving additional radiation in a desired direction, but I'd never try to predict it or control it. Use the balun because the benefits of keeping the RF "out there" are considerable: Less TVI, no false ringing of your telephones, less squawking from your computer speakers, no computer mouse or keyboard doing its own thing, no cable modem resetting itself, no RF burns on your fingertips (although there are other ways to get them, hi-hi).

The lack of a balun may not cause every listed malady, above, but that's a short list of some that I have caused or witnessed from a quick-rig antenna that didn't have a balun. They went away when one was installed.

That's because you are calling it a dipole and assuming it is a balanced antenna. In reality, it's a quarter wave sideways vertical wire antenna, with a single quarter wave radial at the feed point.

See, now it all makes sense. :-)

Or a quarter wave end fed horizontal antenna with a single tuned feed point radial.

Not only that, I wonder if I can patent them, and sell them via a web site for big bucks.

Geoff.

Turns out he's located in Germany, so U.S. codes aren't particularly
relevant. If anything, German codes are probably stricter. But almost
certainly different.

Source record: 15844

John KD5YI wrote:
> Wake up, Cecil. The 6.75 inch long Texas Bugcatcher coil falls into the
> lumped component category (being only .002WL at 75m).

Sorry John, we are not talking about *physical* length
- we are talking about *electrical* length which, like
a piece of coax, depends upon the velocity factor. The
velocity factor for a Texas Bugcatcher coil is ~0.02.

6.75"/0.02=337.5", 337.5"/12 = 28 feet,
28'/(246'/lamda) = 0.114 WL

Thus a 75m Texas Bugcatcher loading coil is electrically
about 41 degrees long at 4 MHz. Hint: It is a slow-wave
structure described in "Fields and Waves ..." by
Ramo, Whinnery, and Van Duzer, 3rd edition, page 476.

The equation for the approximate velocity factor for
an RF coil meeting the specified physical conditions
is given in equation 32 on page 4 of:

http://www.ttr.com/TELSIKS2001-MASTER-1.pdf

Fig. 1 gives the VF for various diameter/wavelength
ratios and turns/wavelength. Here's how to determine
the VF from the Fig. 1 graph.

For the coil in question, calculate the
diameter/wavelength ratio and plot it on the x axis.

The diameter/wavelength ratio for the Texas Bugcatcher
is ~0.5/246 = 0.002, i.e. 2x10^-3 on the graph.

For the coil in question, calculate the
turns/wavelength ratio and select the proper curve.

The turns/wavelength ratio for the Texas Bugcatcher
is 4tpi*12*246' = 11,800, i.e. slightly to the left
of the left-most 10k curve.

That puts the Texas Bugcatcher squarely in the slow-
wave category with a velocity factor of ~0.02.

This is true for orbital electrons but not true for
free electrons as exist in conductors like copper
and aluminum. Free electrons can emit photons of any
frequency. We change the transmitting frequency of
the photons by adjusting our VFOs to virtually
limitless frequencies.

You'll still need to deal with RF currents flowing on the outside of the coax (and also potentially between inner and outer shields).

A good transient suppression scheme at the entry point deals with the overvoltages from lightning, power lines falling on your antenna, etc.

The challenge is in protecting a sensitive receiver front end, while not introducing other problems: if the receiver burns out at 1Volt, a clamp at 300V isn't going to save the front end, although it will keep the radio from catching on fire. A diode clamp to the supply rails or similar will save the front end, but will almost certainly result in IMD issues with strong input signals. Sometimes, the front end just has to be the sacrificial "fuse", so you want to make sure that it's a cheap & replaceable part that suffers.

Yes indeed. It's not like there's any universal consistency in the U.S.
either.

I recommend IEEE Std 1100 for people who really care. (and it is an
international standard, so it addresses most of the regulatory issues
regardless of location)

Let me try again and put it another way. What if:
The transmission line is a two parallel wire system.This is enclosed
in one sided metalized mylar isolated shielding Total covered with
insulation and wire netting for true ground ? All of the above buried
in ground

I think any inductor with the same inductance, Q, and self-resonant frequency will give the same velocity factor and delay as your Bugcatcher. I don't think that neither the coil nor the "stinger" knows how the inductor is constructed. I think the slight difference due to radiation from the Bugcatcher can be ignored since it is small physically.

I think you will measure the same velocity factor with any other coil that gives the same inductance, Q, and self-resonant frequency regardless of whether it is wound on air, a toroid core, a ferrite rod, or a beer can. If so, then that coil will be a distributed component according to you because it meets the electrical requirements.

John

Well, sure.. (leaving aside the problems of running a two wire line
inside a tube) At some point, though, something's got to emerge from
the shielded cage or it's not a electric dipole antenna. (One can make
a totally shielded loop antenna, of course)

That may or may not be true - I don't have an
opinion one way or another - and it is NOT part
of my argument. My argument deals only with
75m Texas Bugcatcher coils and other large air-
core loading coils used on 75m.

My argument is that the velocity factor of a 75m
Texas Bugcatcher coil is ~0.02, occupies ~41
electrical degrees on 4 MHz, and exhibits a
delay of ~28 nS through the coil. That is my only
argument. I am not interested in diversions from
that argument.

My argument also includes the 100 turn, 10 inch long,
2 inch diameter coil that w8ji used for his 3 nS delay
"measurements". If he had used traveling wave current
for the measurement, he would have measured approximately
25 nS.

Maxwell's equations for slow-wave structures (like
a 75m Texas Bugcatcher loading coil) are given in
"Fields and Waves ...", by Ramo and Whinnery:
pages 467-479 in the 2nd edition. This is one of
the references in the Corum IEEE paper.

What do you make of Roy's (w7el) statement at:

http://www.w8ji.com/agreeing_measurements.htm

"As described in my posting on rraa of November 11,
the inductor 'replaces' about 33 electrical degrees
of the antenna."

I don't know about waves but my understanding is that all colors come
from the mixing
of the three basic colors, or is it four? When you mix frequencies I
would imagine you could arrive at all possible frequencies. I think
you should drop the idea of waves with respect to frequency. If you
observe a rainbow how many basic colors are there in the mix! In a
projector isn't there just three filters required for a movie in
color? One thing you have to get into your mind is the idea of basic
temperature and mass without energy. the case prior to the big bang.
The temperature aspect is very important input
of the inpact of energy at the initial stage where decelleration of a
particle in a changing medium generates a change in temperature which
is also synonimous with particle temperature. You are for ever
compartmentizing every thing as if there are no connections to be had
as per G.U.T. or more to the point static versus dynamic fields.
You are way to quick to say that you can't and should listen to OBAMA
who states yes we can.

Presumably there is a lower limit to the number of turns the coil would have to have, or an upper limit to the pitch angle, in order to behave as described - a helical sheath. Tesla coils usually have at least a few hundred turns wound closely together, and often operate at wavelengths considerably longer that 75 meters. One could easily argue that 30 turns do not a Tesla coil make, in which case Eq. 32 would not apply.

That's the RGB standard designed for fooling human
eyes into seeing more than just red, green, and blue.
Photons in nature come in *all* EM frequencies.

If it IS true, then the point I tried to make that you are making a distributed component from a lumped one is valid. That's what caused me to object to your earlier post.

And, by the way, I feel the same way you do except about people who are afraid to consider lumped components. Perhaps they do not have what it takes to judge when a proper substitution can be made.

John

Your understanding is in error... at least, if you're referring to colors in terms of actual photon behavior (energy and wavelength) rather than to the human *perception* of color.

>That's the RGB standard designed for fooling human
>eyes into seeing more than just red, green, and blue.

Yup. And, the red/green/blue system is an artifact of the human visual system... most of us happen to have three different types of photo-sensitive molecules in the cone cells in our eyes, and these three types of molecules have their peak receptivities at the frequencies that we refer to as "red", "green", and "blue."

There seems to be some amount of genetic variation, among humans, in the exact frequencies at which the peak sensitivies lie. And, some people have are missing one or more of these types of photoreceptor, and are referred to as "colorblind".

There are apparently some humans who have four different types of photopigment, and thus may have an improved ability to perceive distinctions between colors. Certain species of animal are known to have four photopigments (one for e.g. UV sensitivity) and I wouldn't be surprised if some species have five or more variants.

>Photons in nature come in *all* EM frequencies.

Yup again. It's an interesting process:

- Light comes in a continuous range of frequencies.

- Our eyes "sample" this continous range, with three types of sensor having different-but-overlapping sensitivities. Each sensor generates a variable amplitude (or pulse train) based on the intensity that it's detecting, within its sensitivity range.

- Our nervous system maps the three amplitudes back into a perception of a continuous range of colors.

The process is far from perfect... information is lost during the sampling process, and thus the perception of a continuous spectrum is necessarily flawed and imperfect.

This is why a mixture of two different pure colors (e.g. red and green) can look like a single pure color to our eyes (e.g. yellow or

amber)... it happens to excite the red and green photosensors in the
same proportion that a single, pure-yellow light would. Mixed
together, the colors look like one... split them apart with a prism
and you can easily distinguish them and see the trick.

[Almost] All Is Illusion.

Cecil
Seems like this thing called photon is the magic article that created
the big bang.
You attribute everything to the photon but I don't think physics as
got a proper handle on it! Heck, only a few years ago they said a
particle could exist without mass.If a particle emitted from the Sun's
boundary(lepton?) deaccellerated in a particular medium
and broke apart into many electrons, then would not heat or light be
emitted as kinetic energy contained in the particles of different
sizes representing the spectrum
of a particular color with respect to potential energy contained in
the various sized particles? Does your photon come in different sizes,
color and potential energy?
My understanding is that there are about seven leptons that break away
from the Sun's boundary, three of which contains color attributes
along with other flavours which is indicative of temperature and
change in momentum.
I think it is to early to argue about such a subject.

Maxwell's equations don't say anything about "slow-wave
structures." If they did, you couldn't understand the vector
calculus involved, anyway. This is more picking and choosing
from authorities.

Are you sure that isn't a quote from Reg Edwards, whose ideas you stole in the first place? Reg thought that antennas were transmission lines. There's nothing wrong with that. Reg even worked out some practical formulas based on his ideas that seemed to work well enough for who they were for. What he didn't do was discover any laws of nature, any more than you have.

Anyone can take a small inductor, such as Roy described, and try to
analyze all the currents and such in it using a distributed model at low
or moderate frequencies. If they do, though, they'll just come up with
what they'd have come up with treating their small inductor as a
lumped element. Cecil has distributed elements on the brain. It's what
comes of falling in love with your own theories.

Yes seperate the vertical elements a few inches and tie them together
at the feedpoint. works great some interaction when tuning each for
lowest swr on each band.

> that 30 turns do not a Tesla coil make, in which case Eq. 32 would not
> apply.

Dr. Corum says that it behaves as a helical sheath when it is electrically longer than 15 degrees (0.04WL). The frequency doesn't matter - just the electrical length. Of course, it takes more turns at a lower frequency since the reactance is proportional to frequency. Eq. 32 is not concerned with the number of turns, just that the coil is electrically longer than 15 degrees and is therefore outside the range for which the lumped-circuit model is valid.

Note that the title of the paper is: "RF Coils, Helical Resonators and Voltage Magnification by Coherent Spatial Modes". "Tesla coil" does not even appear in the title.

A Tesla coil can be 1/4WL self-resonant all by itself. Thus, 30 turns could easily be a Tesla coil over a certain range of HF frequencies.

Some Tesla coils have a top hat and are operated below their 1/4WL self-resonant frequency.

In Dr. Corum's paper, take a look at "Figure 2, A capacitively tuned distributed resonator" and tell us how it differs from a 75m mobile antenna with a top hat.

The 1/4WL self-resonant frequency for a 75m Texas Bugcatcher coil has been measured at ~6.5 MHz where it is known to be electrically 90 degrees long. Why does anyone have a problem with it being electrically 40 degrees long on 4 MHz?

In "Fields and Waves ...", by Ramo and Whinnery, the analysis of a helical sheath assumes an infinitely long helical sheath for the purpose of eliminating reflections. Does that ring a bell? Hint: The current

on a standing-wave antenna cannot be used to measure
phase shift or delay. Yet, that is exactly what w8ji
and w7el tried to do.

I once turned my 75m mobile Texas Bugcatcher system
into a Tesla coil. I had a latch to which I could
connect the top ball of the antenna when I needed
to lean it over for more clearence. I was at a hamfest
at night and had forgotten I had the antenna latched
down. I started transmitting and my friend told me
I was drawing a two-inch arc from the tip of my antenna
to the pickup body. It was indeed "Voltage Magnification
by Coherent Spatial Modes".

There are coils for which the lumped-circuit model
is valid.

There are coils for which the lumped-circuit model
is not valid.

I am only interested in discussing coils for which
the lumped-circuit model is invalid, i.e. coils that
are electrically longer than 15 degrees, e.g. a large
air-core 75m Texas Bugcatcher coil which measures
about 40 degrees on 4 MHz.

I honestly don't know if the lumped-circuit model
works for 70 uH toroidal coils. I do know it doesn't
work for a 75m Texas Bugcatcher coil.

The people who insist on analyzing tiny toroidal coils
instead of 75m Texas Bugcatcher coils are afraid of
the technical truth and it's easy to see why.

It comes in different wavelengths. It certainly
comes in any and all colors and frequencies outside
the range of "color". All of its energy is the
result of its speed of light velocity. It has
zero rest mass. It has the equivalent of mass
when traveling at the speed of light. m=e/c^2

a 75m Texas Bugcatcher coil along with some technical
proof that I am wrong. All I have gotten so far is
ad hominem attacks. Where's the beef?

Dr. Corum's empirically-based equations do not work
for toroidal inductors so they are outside the scope
of my discussion. Why not discuss the most common
large air-core coils used for loading 75m mobile
antennas?

> No he wouldn't. You don't know what he would have measured.

I have exactly the same coil that Tom used for his
"measurements". I have measured the traveling wave
delay through the coil by loading it with a 5k
resistor to eliminate reflections. I do know what
he would measure if he would only run the experiment
correctly. You could do it too if you so chose. x and
y are the current sample points.

```
source---x-Tom's coil-y--5k load

You are free to access the above web page to see who
wrote it. If Dr. Corum stole Reg's ideas, he should
have given him the credit. Dr. Corum does provide
50 references for his paper but Reg is not one of them.

However, here is a partial list:
7. J. D. Kraus, "Antennas"
19. F. E. Terman, "Resonant Lines in Radio Circuits"
23. J. D. Ryder, "Networks, Lines, and Fields"
29. S. Ramo and J. R. Whinnery, "Fields and Waves in Modern Radio"
30. R. W. P. King, "Electromagnetic Engineering"
43. M. Born and E. Wolf, "Principles of Optics"

One wonders why some people insist on a "small
toroidal inductor" which obviously agrees with
the lumped-circuit model instead of analyzing
a 75m Texas Bugcatcher loading coil which just
as obviously violates the presuppositions of
the lumped-circuit model.

Instead of the "small toroidal inductor", let's
discuss w8ji's 100 turn, 2" diameter, 10 inch
long air-core coil through which he measured that
ridiculous 3 nS delay after which w7el posted some
"agreeing measurements" while asserting that the
electrical length of the coil was 33 degrees.

Does anyone else realize that 33 degrees in 3 nS
at 4 MHz is faster than light speed?

Are you guys so afraid of losing face that you
are willing to post technical falsehoods?

:-) And obviously it's electrical length depends on Vp, which depends on
whether it behaves as a helical sheath.

Maybe it is. I happen to think that because of its simplicity, it's an
attractive notion. But it's not clear to me that the article applies to
coils with these parameters, and I haven't seen any (reputable)
empirical evidence to support it.

No offense, but some of their work seems aimed squarely at the 'Art Bell' crowd. Describing constructive interference as "voltage magnification" is an example. It's as if they were publishing in the 19th century.

As a matter of fact, Dr. Balanis did agree with me
when I took his antenna class at ASU in the early
90's. There were some Motorola people in the class
who asked, "Why do Intel people know so much about
antennas?" Dr. Balanis and I worked closely together
on a joint ASU/Intel project.

The complete absence of technical rebuttal in your
posting is noted. I don't know much about you, Tom,
but you seem to be more ad hominem than technical.

I agree whole heartedly. Maxwell never included slow waves which is a result of lumped loads. Maxwell equations studies have been rigorous with respect to accounting for all forces involved in radiation for maximum efficiency. It stands to reason then that for efficiency a load is not valid. Thus Reg was correct in seeing a transmission line as an antenna with just distributed loads when the length is in terms of a WL i.e. in equilibrium. Thus Kraus's antennas are not in equilibrium and thus deviated away from Maxwell's laws. Same goes for Corum ! And Ramo still talks of waves so he is in the same bracket.
All electrical engineering turns topsey turvey
when engineers are forced to consider particles instead of waves and I will be the leader of that change that will stop CERN in its tracks

There is a test equation in the Drs. Corum paper that
indicates whether a particular coil meets the requirements
for a helical sheath or not. A 75m Texas Bugcatcher coil
meets the requirements. A small toroidal coil does not.
If you had ever actually read the article, you would know that.

> Are you trying to imply that the paper isn't about Tesla coils?

No, I am asserting that the paper isn't *only* about Tesla
coils. It is about RF coils in general. Hint: "RF Coils"
are the first two words in the title.

> it's a 'cartoon'.

Actually, it's a graphic diagram of a Tesla coil with
a top hat or a 75m Texas Bugcatcher with a top hat.
There is no conceptual difference in the diagrams.
The only difference is that we hams avoid arcing
by running reduced power compared to Tesla coils.

> But it's not clear to me that the article applies to
> coils with these parameters, and I haven't seen any (reputable)
> empirical evidence to support it.

Then I would suggest that you read the article. There is
a test for validity on page 4. Let's see if you can
use your "expertise" to locate it.

Actually, I will make it easy for you. Here is an EXCEL
file that I generated based on the Corum paper which
includes the test for validity in red.

http://www.w5dxp.com/CoilZ0VF.xls

> What do you suppose Corum^2 meant when they wrote "Experimentally, the
> wave velocity and velocity factor may be measured by determining the

EZNEC can do that for us since EZNEC will display the
current in each segment. I have been explaining that
for five+ years. Have you not looked at any of the
EZNEC results I have posted or have you just not been

able to comprehend them? It can also be done, as it
was for Tesla coils, by measuring the electric field
along the coil.

> Describing constructive interference as "voltage
> magnification" is an example.

Well, don't blame me. Drs. Corum think they are the
same thing, just using different words. I understand
what they mean. Obviously, the highest "voltage
magnification" occurs at the point where the forward
and reflected voltages are in phase, i.e. constructive
interference. If you disagree, let's hear your theory
on the subject.

Jim, you seem to object to anyone, including Drs. Corum,
choosing slightly different words from the ones you would
choose. Are you actually omniscient?

On the contrary, in the early 90's I had not published
my ideas yet. Dr. Balanis helped me to develop the very
ideas that I have published and he agreed with them.

> Come up with some evidence that makes sense concerning your
> ideas and we can talk.

I have presented my evidence long ago and you have
ignored it in favor of ad hominem attacks. I cannot
recall a single technical argument from you. For all
I know, you are an 8 year old brat with access to
his mother's computer.

I would like nothing better than to engage in a real
technical argument with you. You can start by producing
technical arguments against the information on my web
page. If you have EZNEC, you can verify everything I
say by downloading the EZNEC files at:

But Cecil the Bugcatcher does not conform with Maxwell's laws and
EZNEC has no provision to explain to you when you deviate from
Maxwell's laws with invalid designs
All Eznec does is to apply the best math available via approximations
to what you direct it to do. It is not able to inform you or change
the input so it does conform to Maxwell's equations. A typical
description of garbage in garbage out with respect to a rigourous
examination for accuracy. So to refer to Eznec as an authority of
accuracy is the same as an author who details all that agree with him
at the outset. This is not
to say that EZNEC is not a useful tool or not close in it's
approximations. It is a tool that matches the requirements of the
average ham and the education given him.

The visible spectrum does not include "basic colors" It pretty much has
all of them. Well, not Magenta. Is magenta a color?

And when you talk "basic, are you talking Cyan, Magenta, Yellow, or Red,
Green, Blue. It makes a difference.

That would be a black body radiator at absolute 0.

So you have the omniscient gift of recognizing
bullcrap just by observing it with absolutely
no technical rebuttal and no possibility of
your being conceptually wrong? Exactly what
is it about Drs. Corum paper that you don't
understand?

Jim, if you want to retain one iota of respect,
please present a technical argument to refute
what I have asserted. Your gut feelings of
"bullcrap" are completely irrelevant. How about
your equations that prove Dr. Corums's IEEE
paper's equations are wrong?

It's not very simple.

Except for monochromatic light sources like lasers, light of any color contains multiple spectral lines. Sunlight or, for example, an incandescent bulb or red hot electric stove element contains a continuous spectrum, or effectively an infinite number of spectral lines or "colors". So you can't duplicate these with any finite number of spectral lines. The interesting thing is that with only three spectral lines (pure monochromatic colors) you can produce light that *looks* line nearly any color of light that's really made from many spectral lines. For example, (transparent) box A can contain an incandescent bulb whose light contains an infinite number of spectral lines or "colors", box B can produce light with only three spectral lines, and you won't be able to perceive the difference by eye if they're the right colors and brightnesses. This is the trick that makes color TV and color film work. It would be pretty easy to detect the difference with some simple tests, though. For example, the light from the two would look like different colors after passing through various color filters. Or pass the lights through a prism, and you'd see many more colors in the light from the incandescent bulb than the three-color source.

But you can't make all perceived colors from any set of primary colors -- various choices of primary colors give you certain ranges of colors you can mimic. RGB and CMY of particular wavelengths give wide ranges, which is why they're common, but no choice can mimic all. I notice that some color printers have more ink colors, which I assume allows an even wider range. Creating light by combining colors is a different process than filtering white light by subtracting colors or letting only certain colors through. So different primary color sets are required. It's a fascinating topic, and yet another example of how our eyes deceive us.

Roy Lewallen, W7EL

Sorry OM, you haven't proven your argument. You've provided no substantive data, and have shown nothing that indicates that this coil would conduct surface waves or behave as a tightly wound slow wave structure. It that's a Tesla coil, then so is any other coil. I'm just stating the obvious here.

Jim Kelley wrote:
> I'm just stating the obvious here.

One lurker stated the obvious in an email to me.
"It seems these guys will argue that black is white
if it's you that is saying white is white!"

The 75m Texas Bugcatcher loading coil satisfies the
boundary conditions given for a slow-wave structure.
What is obvious is that you and others absolutely
refuse to engage in any technical argument concerning
the subject. It is indeed obvious why you refuse to
do so.

Jim, I ask you again: How can one possibly use the
following current as reported by EZNEC to measure
the delay through a wire or through a loading coil?

EZNEC+ ver. 4.0
1/4WL vertical 5/7/2009 5:34:16 PM
--------------- CURRENT DATA ---------------
Frequency = 7.29 MHz
Wire No. 1:
Segment Conn Magnitude (A.) Phase (Deg.)
1 Ground 1 0.00
2 .97651 -0.42
3 .93005 -0.83
4 .86159 -1.19
5 .77258 -1.50
6 .66485 -1.78
7 .54059 -2.04
8 .40213 -2.28
9 .25161 -2.50
10 Open .08883 -2.71

Your silence on the subject has so far been deafening.

How do you explain Roy's (w7el) assertion at:
http://www.w8ji.com/agreeing_measurements.htm

"As described in my posting on rraa of November 11,
the inductor "replaces" about 33 electrical degrees
of the antenna."

w8ji's measurement was a 3 nS delay. If an EM wave
can travel through 33 degrees in 3 nS at 4 MHz, it
is traveling considerably faster than the speed of

light which is entirely possible with the lumped-
circuit model. How do you explain that?

Ask as many times as you like. You're asking me explain how to use a printout from a computer program to measure current. The question makes no sense, Cecil. What I'd like to know is how is one supposed to respond to such nonsense.

If what you want to know is how to measure current on a coil, I suggest that you need to build a current probe. Ask W8JI about it. According to your reference, the Corum paper, you would then plot current as a function of position along the axis of the helix. From that one can determine the axial length of the standing wave pattern - the length of the wave, so to speak. Given the frequency and the wavelength, one can easily arrive at the propagation velocity. If you need help with it, good luck.

I looked up the references and here are my comments
1 a helical is not in a state of equilibrium
2 A radiator that is not a WL or multiple thereof is not in
equilibrium
3 It refered to boundary laws and then mis used them.
4 The beginning was littered with "assume" and terms of" Aproximation"
5 It then went on to change the configuration of a helix to a
configuration that
he thinks he has solved when using the approximations. He also assumed
that the speed of light could be exceeded
6 I saw no evidence of accounting for the flux in a clockwise versus a
counterclockwise action tho apparently he made assumptions that
circular motion was zero.
7Frankly Cecil he knew what answer was to be accepted by reviwing
Krauss's work and devised his mathematics accordingly
8 Krauss's work was on the subject of a helical that was not in
equilibrium which thus forced him to include the helix angle which
also is nowhere to be seen in Maxwells laws.
The reference he used is not credible but name dropping of those that
he agrees with
is a confidence builder for those you judge plagurism as being with co
believers.
This is the same as those who defined light as a wave where academics
followed
with smiles and without question.
It all still comes back to the fact that in boundary laws the contents
must be in equilibrium and nothing about your antennamatches that
requirement
Sorry about that Cecil No harm meant

Oooops, I forgot the real biggy.
You mentioned that a spark was emmited from the end of your antenna. I am sure you are aware that this is symbolic of end effect.
Maxwell has no equation for end effect ! Nor did he see the need to account for that force. Why? Because that is representitive of a radiator that is NOT in equilibrium. It takes a circuit of 1 WL or multiple there of to reach the state of equilibrium.
This is why the radiator at Quito Equador was changed to a quad ala 1 WL just to get rid of "end effect" which is of no help in terms of directivity just a waste of radiation energy. I will say it again, boundary laws as does all the laws of our Universe demand
that a state of equilibrium is present such that it meets Newtons law that "every action has an equal and opposite reaction" which in mathematical terms for the boundary aproach is that all forces summed equals zero.
I feel that this debate has now come to an end. Maxwell's laws are not applicable or valid when a radiator is not in equilibrium. And resonance does not equate to equilibrium because end effect is not present and thus not applicable with respect to Maxwell.
Best regards
Art'

Further on this topic: one of the interesting things that comes up when you look into "white" LED or fluorescent lights is that they pretty much all have "holes" in their spectra. That is, the spectrum they emit isn't continuous and the same shape as with light from an incandescent source (including sunlight). The result is that some things which reflect strongly over a narrow spectral band and much less outside that band will look funny under such an LED or fluorescent light. The light reflected by the object under such a light doesn't have the "right" spectral shape. But it's something that the lamp manufacturers are paying special attention to these days, and you can find ratings on many bulbs about how good a job they do at color rendering.

Cheers,
Tom

2869. wave polarisation

Newsgroup: rec.radio.amateur.antenna

Hello,

Under normal circumstances, polarization change in line-off-site conditions (think of max 40 mile) is not that much, so antenna polarization does matter (unless you use at least circular polarization on one side).

In a propagation path that is dominated by multi-path effects (reflection at buildings, hills, foliage, etc), you get almost random polarization and then the polarization is not that important. Your cell phone and indoor WIFI are examples.

Extreme weather conditions can also lead to polarization changes or a random polarization component (ducting superrefraction).

For sea water up to VHF, reflection depends on polarization. For ground-ground links (for example ship shore) mostly vertical polarization is used (as the sea water helps in this case). So if you want to receive these communication, you use a vertical polarized antenna.

The largest change in polarization you will get when the waves have to travel through the ionosphere. At HF (ground-ground link via ionosphere), the polarization vector rotates many times. This is due to Faraday rotation. Also ground-satellite links suffer from this effect. The higher the frequency, the less the change in polarization. For example at 100 MHz you should think about 30 full rotations (that is more then 10k degrees), while at 10 GHz the change in polarization will be about 1 degree. Circular polarization may help to mitigate the influence of Faraday rotation.

At HF sky wave (100....>1000 mile via ionosphere) polarization of the antenna matters. This is not because of the polarization change of the waves due to Faraday rotation, but because of the reflection

characteristics of mother earth. In HF antennas, reflection on mother earth is used (in combination with antenna height) to get the required elevation radiation pattern of the antenna. Reflection on earth depends on polarization.

Hopefully this helps you a bit.

You're preaching to the choir, Jim. You and I know that
the phase information for a standing wave is contained
in the amplitude and the phase relative to time is constant
at all points on the antenna for any particular time.

What you should be doing is explaining that to w7el and
w8ji because they don't seem to understand that the
current phase in standing wave antennas does NOT change
with distance. Here's an earlier question that you guys
ignored. Given a 1/2WL dipole with current probes at x and y:

---------------------------fp--------x--------y---------

points x and y are 30 degrees apart. What will be the
difference between the phase of the current at x and
the phase of the current at y? EZNEC says ~1 degree.
How can current phase change by one degree in 30
degrees of wire?

Tom Donaly wrote:
> Cecil's using the old "You cain't prove it ain't" argument.

I have presented my arguments. Nobody has refuted
them technically. All the objections have been ad
hominem or based on false premises.

A 75m Texas Bugcatcher coil meets the Corum test
for a helical sheath. That test is on page 4 of:

http://www.ttr.com/TELSIKS2001-MASTER-1.pdf

"... is valid for helices with 5ND^2/WLo < 1
where N is the TPI and D is the diameter."

That figure is 0.244 < 1 for the 75m Texas Bug
Catcher used on 4 MHz.

5*4*6^2/2952 = 0.244

So all you guys have to do to shoot down my analysis
is to prove that 0.244 is not less than one.

Tom Donaly wrote:
> If Roy and Tom Rauch couldn't make you see reason, no one can.

Roy and Tom are the ones committing the technical
blunder of trusting their phase measurements using
a current that doesn't change phase relative to
the source phase anywhere up and down the thin-wire
1/2WL dipole. Now you and others are helping them
to sandbag their technical myths and hoodwink the
unwashed masses. If that's what you want for a
reputation, be my guest.

EZNEC agrees that the relative phase of the current
on a standing wave antenna doesn't change anywhere
on a 1/2WL thin-wire dipole so it cannot be used
to measure the phase shift through the wire. EZNEC
says that the phase of the current on a standing
wave antenna changes about 1 degree for every 30
degrees of antenna wire. Roy and Tom would have to
admit that is considerably faster than the speed
of light. Of course, that's exactly what the
lumped-circuit model presupposes - instantaneous
propagation through the lumped-inductor.

Since that current cannot even be used to determine
the phase shift through the antenna wire, how can anyone
honestly assert that it can be used to determine the
phase shift through a loading coil?

not that has been reported anywhere i have seen. this is likely because
that at the low amplitudes of radio waves relative to the energies needed to
create non-linear effects the medium is close enough to linear that any
doubling effect is too small to see.

of course it is, there is an equals in the equation so it must be in
'equal'ibrium according to your definition.

>equilibrium

my half wave radiator, and my infinitesimal dipole both have equals signs in
their equations to they must be in your state of 'equal'ibrium also!

The laser must be fed into a non-linear medium for the doubling to
occur. The same would be true for RF.Normally the atmosphere and space
are considered fairly linear in respect to both RF and light, both
forms of EM radiation. Luckily for us this is the case, otherwise all
radiation would be multipled to xrays and beyound. The result would
probablybe the termination of all life as we know it.

AHa! I was going to write about the emulation of color, but wasn't sure if I'd just confuse things. But you've done a good job describing it, so here we are.

So called "Lippmann" emulsions can do color correctly, but they work on a wavefront basis instead of combining colors.(the individual particles of silver are extremely small, so they can do that) A color Lippmann image can be gorgeous, but they are really difficult to make, so are more of a curiosity than anything else.

> which is why they're common, but no choice can mimic all. I notice that
> some color printers have more ink colors, which I assume allows an even
> wider range.

That's a big part of it. Inkjets have some mechanical issues too, such as the best looking colors might not last very long, or a good long lasting color might be hard to squeeze through the little jets. SO we get stuck with multiple color cartridges. But for the purposes at hand, the color perception issue is the big one, and the others can be ignored.

You can get ionospheric mixing of radio waves. e.g Luxembourg Effect; so
doubling is possible.

I also once heard a mixing effect of the 10MHz Time signal MSF with the
60KHz time signal ,producing two sidebands at 10.060 and 9.030 MHz, but
that could have been an effect at the transmitter site.

Maybe WWV does the same - take a listen; it's not strong enough here.

I think this message can be of interest for those using Excel for antenna calculations.

Write in one cell: =(-A1^2 + 8) Note: the exponent of A1 is 2 (and not 2+8=10) because Excel performs squaring before summing

Write in another cell: =(8 - A1^2)

They look pretty much the same

But give A1 any non-zero value and see what happen.

I see it give the correct answers!!!

eg when A1 =2 the first formula =12 and the second =4

-2 squared =4
So 4 plus 8 = 12

2 squared =4
So 8 - 4 = 4

8 - (2 squared) = 4

Yes, but the way Excel works is deceiving.

As a matter of fact, with reference to the general mathematical principle A+B =
B+A, let us have:
```

A= -A1^2
B = 8

Then, one would expect that -A1^2 + 8 is the same as 8 - A1^2, which is not the way Excel works.

Still here, and still trying to strip away the personal attacks to try to understand the various underlying technical opinions!

When I model a "bugcatcher" plus stinger using EZNEC, I see significantly less current at the top of the coil compared with the bottom of the coil. I also see a slight increase in current part way up the coil before it then decreases towards the top.

In reply to an earlier question of mine, Roy assured me that this current distribution was "real" and not some problem that EZNEC has modelling this arrangement.

I have two questions if I may:

1) Cecil: I believe I understand how the Corum transmission line model accounts nicely for the reduced current at the top of the coil. Does it also account for the slight increase in current a short way from the bottom?

2) Jim, Tom, Roy (and any others): It appears you think the Corum model is flawed, or not appropriate to the "bugcatcher". What I've not yet understood is what alternative model you are advocating which would match the EZNEC results more closely than the Corum model. I've heard at least Roy say that a lumped-inductor model is inappropriate, but I don't think I've yet heard any other model proposed. Perhaps I missed it?

EZNEC _is_ a model. If you can accept that, then you've got your model.
If you want to know why current is less at one end of the bugcatcher
coil than at the other, you'll have to study electromagnetic theory.
(Try adding a large top hat to the bug catcher and see what that does
to the current in the coil.) If you're satisfied with Cecil's work,
fine. Whatever works for you. Rules of thumb and such sometimes work
pretty well. The late Reg Edwards knew that and worked out some programs
that relied on such. You might want to see if you can find some of his
work on the web.

In correct mathematical convention the expression
let A1 = 2 then

-A1^2 must yield

-A1^2 = -4

otherwise we would have to write
(-A1)^2 = 4

EXCEL does it the wrong way in example 1: =(-A1^2 + 8) = 12
and does it correctly in example 2 =(8 - A1^2) = 4.
But they are from Microsoft and they can do whatever they want.

Hi Steve,

Personally, I think some actual measurements would help enormously in
formulating/evaluating a model. Otherwise all we have is hand waving
and proselytizing.

But guys you are jumping to fast with your statements and conclusions.
Go back to the basics and start afresh.
Remember we are seeing color as representitive of temperature and the
mass and potential energy that is affected by a particles passage
thru a medium. Thus the temperature spectrum compares with the total
color spectrum which covers all the frequencies involved.
Thus a clump or cluster of particles entering a different medium
represents all frequencies and dependent on the dispelled kinetic

energy of each with respect to their mass covers all the colors
possible. In other words a single particle disposed to the red
spectrum
can supply all the different hues of red all of which are dependent on
the mass,
expended kinetic energy, and the ratio of expended energy to
potential energy when encountering a change of medium. A blacksmith
does this all the time when reviewing color on the impact of his
hammer without thinking. Even the X ray frequencies have color

> the bottom?

I will say, apparently not. The Corum equations are stated
to be plus or minus 10 percent. The current increase in the
coil appears to be about 10%.

Typically, the current increases from a normalized 1.0 at
the bottom of the coil to about 1.1 close to the middle
and then falls off from there to 0.8 or so. Empirically,
it seems that one can take the rise in current, i.e. 0.1,
from the bottom of the coil to the middle of the coil and
subtract that value from the current at the top of the
coil to compensate mathematically for the curve not being
a pure cosine curve because of end-effects of the coil.

Example: Given a coil with a current of 1.0 at the bottom,
1.1 at the midpoint, and 0.8 at the top. It appears that
the ARCCOS(0.8-0.1) = ARCCOS(0.7) may yield an approximation
for the delay in degrees through the coil, i.e. ARCCOS(0.7)
equals ~45 degrees.

This makes sense to me since the current profile through
the coil is obviously not a pure cosine wave. It is obviously
distorted by the turn-to-turn coupling of the fields. But
just as obviously, this is an empirical curve-fitting technique
as used by Drs. Corum.

I share your opinion. But there are two Microsofts.

- for Microsoft#1, that is Excel: (-2^2 + 8) = 12

- for Microsoft#2, that is Visual Basic: (-2^2 + 8) = 4

Funny, isn't it?

Yes, that is what I normally do.

Anyway it is good to keep in mind that:

- for Excel: (-2^2 + 8) = 12

- for Visual Basic: (-2^2 + 8) = 4

I have reported my 25 nS actual measurements
using my dual-trace 100 MHz o'scope.

I assume that your physics lab has the ability
to perform such a simple measurement. May I
suggest that you simply perform the experiment
and report the results - or get one of your
students to do it.

I suspect that others have done such experiments,
measured what I measured, and are withholding the
results for obvious reasons.

from Maxwell`s laws."

Impossible.

Maxwell`s laws are all that is nscessary and sufficient to describe
radiation from any antenna.

On page 37 of Kraus & Marthelka`s "Antennas for All Applications" one
can read:

"Although a charge moving with uniform velocity along a sreaighr
conductor does not radiate, a charge moving back and forth in simple
harmonic motion along the conductor is subject to aceleration (and
deceleration) and radiates."

To better understand Maxwell and radiation, I recommend
"Radio-Electronic Transmission Fundamentals" by B. Whitfield Griffith,
Jr (now reprinted by Scitech Publishing Inc..

See "Directive Patterns Over Real Groind" in the "ARRL Antenna Book"
for how rays combine to make a pattern.

Best regards, Richard Harrison, KB5WZI

Jim,

I don't have the measurement capabilities that some of you folk have, so I'm just using EZNEC as my "experimental equipment". I'm being assured that it's representative of what I would see "for real", and it's easier pressing keys than building new test equipment :) Are you suggesting that "real world" current measurements would be significantly different than the EZNEC predictions?

I gather from your response that you feel the Corum model is inappropriate for the "bugcatcher", but you're not advocating an alternative? That's the part I struggle with - if a model gets close (albeit not perfect) to predicting "real world" performance, and there's no other alternative being put forward, I don't see the reason for rejecting it so forcefully?

You know quite a bit about antennas, Steve, so you should know the
answer to the following:
1. Mathematically, what does MoM do?
2. Why would anyone use MoM if there were a set of symbolic equations
that would work just as well?
3. When are we going to see the Corum-Moore method in the textbooks?

Hi Tom,

Well I don't know as much about antennas as I would like :)

I take your response to mean that you think only MoM can model a "bugcatcher" coil accurately, and that you are dismissing the apparent accuracy with which the Corum model predicts some coil performance parameters?

I don't subscribe to the Corum-Moore "label". The genesis of the transmission-line approach to coil analysis seems to go back a long way from what I've read, and I don't think Cecil deserves or claims any recognition for it. Besides the method might suddenly begin to appear in all the text books - think how you'd feel then if it included his name;)

at least they are doing what their help says they should do. in vb6
exponentiation is done before negation. in excel negation is done before
exponentiation. when in doubt use more parenthesis than you think you
should to be sure the calculation is done in the order you are expecting.
```

Steve,

Try not to read too much into what I say. It'll save us both some aggravation. What I have said is that in order to validate any particular model, one should make measurements. I don't think there's anything particularly inflammatory or hostile in that view. I respect both Roy and Cecil for their work, though Roy is considerably more careful is his use of mathematics, and I feel has considerably more expertise in RF engineering and physics. I have no particular knowledge or opinion on Cecil's EZNEC files, other than his rather odd take standing wave current phase shift - whatever that is.

So why don't you tell us what you think.

Your answers are just as wrong with a slide rule, an HP15C, Fortran IV on a 360/65, C on a 64 bit AMD or anything else you can find.

And denigrating slide rules is silly. Most of the world that surrounds you was calculated with a slide rule's resolution. When used properly they give answers that are as accurate as is needed for engineering.

You obviously have no clue as to what it takes to do engineering calculations.

Richard, if I used terms improperly, I ask forgiveness.

Nothing would please me more than to see Cecil get his name as a
reference in some textbook. It would mean that there was a high
probability that he finally got it right, and that someone confirmed
his ideas experimentally. It would also give me a good laugh.

You know, you haven't shown that the Corum model accurately measures
the bugcatcher coil. You have stated - and I have no reason to
disbelieve you - that the Corum model agrees with EZNEC. If that's the
case, it's just as easy to use EZNEC, right or wrong. MoM is a method of
obtaining numerical solutions to integral equations. The only reason to
do that is if symbolic solutions are either too difficult or impossible
to puzzle out of those same integral equations. In other words, some
very deep thinkers decided that MoM would give results superior to

algebraic approximations and hand waving, so they applied it to antenna analysis. I don't think it's perfect. It's certainly useful. If you think Corum is good enough for your purposes, though, go for it.

You didn't answer my first two questions, above. That's o.k., they're just something you should think about anyway. Besides, I didn't answer yours concerning why we keep tearing the Corum-as-developed-by-Cecil method down without offering an alternative. Perhaps there is no alternative. Perhaps the best anyone can do is a numerical approximation. Think about that.

There's no point in asking forgiveness from Richard. He's read _Through the Looking Glass_:

"I don't know what you mean by 'glory,'" Alice said.
Humpty Dumpty smiled contemptuously. "Of course you
don't - till I tell you. I meant 'there's a nice knock-down
argument for you!'"
"But 'glory' doesn't mean 'a nice knock-down argument,'" Alice
objected.
"When I use a word," Humpty Dumpty said, in rather a scornful tone,
"it means just what I choose it to mean, neither more nor less."
"The question is," said Alice, "whether you _can_ make words mean
so many different things."
"The question is," said Humpty Dumpty, "which is to be master -- thats
all."

Do you realise that the '-' in both expressions are quite different in
meaning, one is a unary negation operator, the other is the binary
subract operator.

No magic there, force the - to be a unary operator, and it behaves
consistently, eg 8+-2^2 gives 12.

My knowledge on radio waves starts and ends on the description of the Hertz
experiment. So my questions apply to the half wave dipoles.
In the acoustic analogy the Hertz emitter (dipole with the two big balls on
its ends) works like the two monopoles halve wave apart (of course not in
phase). In a few meters from it the Hertz receiver (ring with the two small
balls) works only if parallel. When the receiver is parallel with the
emitter the spherical wave from the upper ball push the electron to lower
halve of the
receiwer and the small spark jump. The frequency is the same
In other orientations the electron in the ring are also moved but the
voltage is equal and no sparks.

But at long distances on every piece of metal acts the two alternating
electric field from the two monopoles. The frequency must be doubled.
Are now antennas similar to Hertz dipole?
Is the frequency doubled.

>The laser must be fed into a non-linear medium for the doubling to
occur. The same would be true for RF.Normally the atmosphere and space
are considered fairly linear in respect to both RF and light, both
forms of EM radiation. Luckily for us this is the case, otherwise all
radiation would be multipled to xrays and beyound. The result would
probablybe the termination of all life as we know it.

Very interesting.
May be it take place. You do not analse the intensity after each doubling.
My question apply to the two sources emitters (oscillatig dipole) in a
lineaar medium.

I realise, but Microsoft apparently does not:

- for Excel: (-2^2 + 8) = 12
- for Visual Basic: (-2^2 + 8) = 4

>> They look pretty much the same
> Not to a programmer!

I would expect that some programmers may get confused, due to the inconsistency
of software products of the same company.

conditions (think of max 40 mile) is not that much, so antenna
polarization does matter (unless you use at least circular
polarization on one side).

>In a propagation path that is dominated by multi-path effects
(reflection at buildings, hills, foliage, etc), you get almost random
polarization and then the polarization is not that important. Your
cell phone and indoor WIFI are examples.

>Extreme weather conditions can also lead to polarization changes or a
random polarization component (ducting superrefraction).

>For sea water up to VHF, reflection depends on polarization. For
ground-ground links (for example ship shore) mostly vertical
polarization is used (as the sea water helps in this case). So if you
want to receive these communication, you use a vertical polarized
antenna.

>The largest change in polarization you will get when the waves have to
travel through the ionosphere. At HF (ground-ground link via
ionosphere), the polarization vector rotates many times. This is due
to Faraday rotation. Also ground-satellite links suffer from this
effect. The higher the frequency, the less the change in polarization.
For example at 100 MHz you should think about 30 full rotations (that
is more then 10k degrees), while at 10 GHz the change in polarization
will be about 1 degree. Circular polarization may help to mitigate the
influence of Faraday rotation.

>At HF sky wave (100....>1000 mile via ionosphere) polarization of the antenna matters. This is not because of the polarization change of the waves due to Faraday rotation, but because of the reflection characteristics of mother earth. In HF antennas, reflection on mother earth is used (in combination with antenna height) to get the required elevation radiation pattern of the antenna. Reflection on earth depends on polarization.

>Hopefully this helps you a bit.

You do not use the words "transversal" and "EM". The only evidence of polarization is antenna directional sensitivity.

In the acoustic analogy a radio waves are normal spherical electric waves emitted from the two sources (ends of the dipole).
So the sources are polarised, not the waves. Waves interfere. Do you agree?
See my topic "frequency doubling" . I am only a science hobyist.

The second question was: " What is the best orientation of the antenna for long distances?
For old radio antennas. Very long horizontal wire.

Best regards,
S*

Tom,

I thought I'd quoted some numbers in the related "Dish reflector"
thread - apologies if I did not. Here are some more:

* I modelled a coil as a spiral in EZNEC (40T, diameter=6",
length=12", #14 copper wire)
* I added a 6ft "stinger" and found the frequency where the
combination was resonant: 3.79 MHz
* I checked the feedpoint impedance without the coil present: 0.46-
j2439
* That tells me the "lumped circuit equivalent" reactance of the coil
at 3.79 MHz is +j2439 ohms
* I found the frequency where the coil was resonant with no "stinger":
6.2 MHz

Now I look at what ON4AA's "Corum method" inductance calculator tells
me:

* "Lumped circuit equivalent" reactance at 3.79 MHz: +j2449
* Self-resonant frequency: 6.3 MHz

Unless I'm missing an option, if I want to predict the RF
characteristics of a "bugcatcher" it seems I have 3 choices:

* Use Wheeler's formula
* Build a helical model in EZNEC
* Use the Corum method

Wheeler's formula is inappropriate at frequencies close to a coil's
SRF.

EZNEC and the Corum method give very close results. The Corum formulas
are not difficult to use; even if they were, there is an on-line
calculator which removes the need for any maths. So it seems to me the
Corum formulas would be the more convenient tool to use, at least for
a "first look".

Do not assume that all languages or all products use the same operator
precedence rules.

The Excel rules are spelled out in the Excel help.

The key thing is that there is a difference in the meaning of '-' in the
uses as the negation operator and subtraction operator, same symbol, two
meanings, you need to understand that when looking in the list of
operator precedence.

Excel spells out clearly that unary negation has higher precedence than
exponentiation, and subtraction is lower than both... so keep that in
mind when writing formulae.

If you are writing VB, use the precedence rules for VB. The VB rules
clearly state that exponentiation has higher precedence than negation,
and subtraction is lower. This may have its roots before the existence of
Microsoft.

Many languages do not have an exponentiation operator, requiring
functions instead (often pow()). Such use eliminates the operator
precedence issue.

PERL does have an exponentiation operator, and it is higher precedence
than unary + and -.

FORTRAN90 does have an exponentiation operator, and it is higher
precedence than unary + and -.

It is part of the programming landscape... algebraic expressions are not universal, they need to be written for the specific language.

Now, I hear that you think that is a bad idea, but it isn't likely to change. It is most unlikely that a new version of any language will change operator precedence, it has too many issues.

Owen

You talked about radiowaves, that are EM waves. In free space, only
progapation mode is transversal (that means both E- and H-field are
perpendicular to the direction of energy propagation. With regards to
audio, in gas, only lossless propagation mode is longitudinal
(molecule movement and pressure vectors are parallel to the direction
of energy propagation) .
>
> In the acoustic analogy a radio waves are normal spherical electric waves

Not agree, the waves are also polarized, that can be physically
measured. Polarization is determined by the E-field vector.

> See my topic "frequency doubling" . I am only a science hobyist.

> For old radio antennas. Very long horizontal wire.

On UHF (for example 2450 MHz), long distance can be 20 km, but on HF
500 km is not called long distance. So the meaning of long distance
depends on the frequency band.

You should distinguish between the actual polarization of the antenna
and the physical appearance. depending on how you feed it, a very long
horizontal wire can be sensitive to vertical or horizontal polarized
waves.

Though the equations for acoustical waves look similar to those of EM
waves, the orientation of the field components is completely
different. When you require a more specific answer, you should make

your question more specific. I tried to give you a general answer for
the various forms of radio wave propagation.

no, your concept is incorrect. the dipole is the whole antenna it is not limited to sources at the ends. even if you do set up a condition with 2 monopoles, like my 160m inverted V array with 2 verticals 1/2 wave apart, the interference does not change the frequency, it changes the intensity. As someone else pointed out, this is because EM waves are transverse waves and the fields add linearly in normal conditions, it takes a non-linear medium to cause mixing.

REAL programmers know the difference and add extra parenthesis just to be
sure the processor does what we want. for instance, i would NEVER use a
unary negate without adding parenthesis to be sure it was applied properly.
In most cases i would write that equation like: ((-1*A1)^2)+8, or even more
obvious in excel: power(-1*a1,2)+8

> or opinion on Cecil's EZNEC files, other than his rather odd take
> standing wave current phase shift - whatever that is.

It's not my take, Jim, it is EZNEC's take. EZNEC
reports current on a standing-wave antenna that
closely matches the standing wave equations for
current whose phase cannot be used to measure
delay through a wire or through a loading coil.

Both w7el and w8ji used the current
on a standing wave antenna to measure phase shift
and predictably, there was negligible phase shift.
They erroneously attributed the lack of phase
shift with a lack of delay, i.e. they assumed the
proof - a well known logical fallacy.

There is no relationship between phase shift and
delay in the current on standing wave antennas
either through the wire or through a loading coil.

"Formula Returns Unexpected Positive Value"
<http://support.microsoft.com/kb/q132686/>

Although this article applies to Excel 97 and earlier versions, the
problem is still there in later versions of Excel.

The article indicates that:
"The order of evaluation of operators dictates that a minus
sign (-) used as a negation operator (such as -1) is evaluated
before all other operators. "
which in my opinion, is wrong. The MS order of operations is:

: Range
space Intersection
, Union
- Negation
% Percentage
^ Exponentiation
* or / Multiplication or Division
+ or - Addition or Subtraction
& Text Operator
= < > <= >= <> Comparison Operators

Note that the negation (negative sign) operator comes before any
arithmetic operators.

I haven't checked how Open Office 3 and others do it. My guess(tm) is
that they all treat the negation operator the same as subtraction
which would be (correctly) evaluated AFTER exponentiation,
multiplication, and division.

Cecil
I believe Steve has vindicated you in your struggle
so you should feel good. I would avoid the tactics if I were you when
attempts are made to reserect this debate.Corum are acknowledged
experts with respect to coils and tho not as absolute as Maxwells
equations one should feel confident with respect to their works so I
feel you have finally made your point.
Well done
Art

Steve, this is fine for a base loading coil, but I'd suggest you try your experiment with a loading coil well up the antenna, where the coil is significantly larger diameter than the straight conductor in which it's placed. The same size coil you described (though presumably a different number of turns), placed at least half way up something like a 15 or 20 foot long thin wire, should illustrate the point. Is the EZNEC model then in such good agreement with placing a reactive load at that point in the antenna, where the reactance is from ON4AA's online calculator?

If I trusted NEC to handle large steps in conductor diameter accurately, I'd suggest putting a segment in the antenna description to represent the length and diameter of the coil, with the calculated reactance placed as a load in that segment. As I understand it, though, NEC has trouble with large diameter steps.

Cheers,
Tom

Yep. The MS precidence is:
<http://support.microsoft.com/kb/25189/EN-US/>

: Range
space Intersection
, Union
- Negation
% Percentage
^ Exponentiation
* or / Multiplication or Division
+ or - Addition or Subtraction
& Text Operator
= < > <= >= <> Comparison Operators

Note that the negation (negative sign) operator comes before any
arithmetic operators. The problem comes from Excel inventing some
kind of distinction between negation (negative number) and
substraction. For arithmetic, there is none. For C programmers,
there is a difference (in the way the data is stored). More on the
subject:
<http://mathforum.org/library/drmath/view/69058.html>

>That minus in front of the A1 is a unary negation, which is a

>
>The Excel answer is incorrect.

Yep. However, MS is not about to create problems by fixing the
problem. It would be a bad thing to have existing spreadsheets,
suddenly give different results when run on updated and fixed
versions of Excel. Compatibility with old bugs is one reason that
bugs tend to be perpetuated. Old bugs and sleeping dogs should be
left alone.

> from ON4AA's online calculator?

The key to understanding this question and its logical
answer lies in the phase shift that occurs at impedance
discontinuities.

For a base-loading coil, there is only one impedance
discontinuity in the system, a hi-Z0 coil to a low-Z0
stinger. That single discontinuity provides a positive
phase shift at the '+' junction of the coil and stinger.

```
coil stinger
FP//////////+-------------------
```

When a straight shaft section is installed under the
coil, it introduces one additional impedance discontinuity
at 'x' in addition to the '+' top of coil to stinger
discontinuity.

```
base coil stinger
FP-------x/////////////+---------
```

Because the impedance discontinuity between the base
section is a low-Z0 to hi-Z0 transition, the phase shift
is negative, i.e. the antenna *loses electrical degrees*
at that junction.

Therefore, more turns must be added to the inductor
to supply the number of negative degrees lost at the
base section to coil impedance discontinuity.

This might best be illustrated with pieces of transmission
line. Please reference my web page at:

http://www.w5dxp.com/shrtstub.htm

The following concepts apply to the above antennas but
may be easier to understand using transmission lines.

Here is a dual-Z0 stub that is physically 44.4 degrees
long but is 90 degrees (1/4WL) long electrically, i.e.
it is functionally a 1/4WL open-circuit stub.

---22.2 deg 300 ohm line---+---22.2 deg 50 ohm line---

The Z0=300 ohm to Z0=50 ohm transition provides for
+45.6 degrees of phase shift. This is akin to the base-
loaded antenna above.

Here is a dual-Z0 stub with 11.1 degrees (half) of
the 50 ohm line moved to the left. (The words are
abbreviated because of space on the line.)

--11.1 deg 50--+--22.2 deg 300--+--11.1 deg 50--

Who can tell me how long electrically is this stub
using the identical feedlines from the above example?

This reconfigured stub with half of the 50 ohm feedline
moved to the bottom is now electrically only ~80.6 degrees
long. What has happened? The new impedance discontinuity
from the base section at the bottom of the coil has cost
us electrical degrees by providing a *negative phase shift*.

How do we solve the problem? Add some length (degrees) to
the Z0=300 ohm section. If we make the 300 ohm section
38.5 degrees long, the stub will be electrically 90 degrees
long once again.

This is conceptually the same problem we encounter when
we move the loading coil from the base location to the
center location. When we move the coil up the shaft, we
introduce a negative phase shift at the bottom of the
coil. Therefore, we must increase the number of turns
to make the loading coil electrically longer.

Incidentally, w8ji knows about the coil to stinger
positive phase shift and describes it on his web page.
He apparently doesn't know about the opposite negative
phase shift at the bottom of the coil where the shaft
attaches.

Cecil Moore wrote:
"One cannot blame one`s ignorance on a lack of textbooks."

True. The most reliable in my opinion is Terman`s 1955 opus "Electronic and Radio Engineering".

Terman agrees with Cecil.

On page 854 Terman writes:
"The laws governing such radiation are obtained by using Maxwell`s equations to express the fields associated with the wire; when this is done there is found to be a component, termed the radiation field, having a strength that varies inversely with distance."

Terman then gives the formula for the electric field strength in terms of distance from the elementary doublets in the wire that make up the antennna to a distant observing point P, and angle of the direction of point P with respect to a plane perpendicular to the axis of the elementary doublet. The strength of the radiated field is distributed in space in accordance with the doughnut pattern for a thin wire which is short compared with wavelength and has a figure-of-8 cross section. Illustrations are provided on page 865. On page 866 Terman illustrates current distribution on an antenna open circuited at both ends and made up of elementary doublets. On page 867 Terman says:
"A wire antenna is a circuit with distributed constants; hence the current distribution in a wire antenna that results from the application of a localized voltage follows the principles discussed in Chap. 4 (Transmission Lines), and depends upon the antenna length, measured in wavelengths; the terminations at the ends of the antenna wire; and the losses in the system. The current distribution is also affected by the ratio of the wire length to diameter in situations where the wire is unusually thick. Under most circumstances the losses are sufficiently low and the ratio of wire length to diameter sufficiently great so that to a first approximation very closely the current distribution can be taken as that for a line with zero losses; it then has the characteristics discussed in 4-5.

Best regards, Richard Harrison. KB5WZI

>You talked about radiowaves, that are EM waves. In free space, only
progapation mode is transversal (that means both E- and H-field are
perpendicular to the direction of energy propagation. With regards to
audio, in gas, only lossless propagation mode is longitudinal
(molecule movement and pressure vectors are parallel to the direction
of energy propagation) .

EM is the hydraulic analogy (by Heaviside). It is a "piece to teach" a field
method.
In that time the electricity was incompressble and massles. Now the
electrons are compressible and have mass.
We need a new analogy. It can be call the Gas analogy or Acoustic analogy.
In www.tetech.nl is wrote that are many analogies for EM.

>> In the acoustic analogy a radio waves are normal spherical electric waves
> emitted from the two sources (ends of the dipole).
> So the sources are polarised, not the waves. Waves interfere. Do you
> agree?

>Not agree, the waves are also polarized, that can be physically
measured. Polarization is determined by the E-field vector.

A dipole has the E-field (in electrostatics). The equations are by Gauss.
The same equations we can use for the Hertz dipole. The E-field will be
alternate.
At long distances the frequency in receiving antennas will be twice more.

>> See my topic "frequency doubling" . I am only a science hobyist.
>
>> The second question was: " What is the best orientation of the antenna

>> for
> long distances?
> For old radio antennas. Very long horizontal wire.

>On UHF (for example 2450 MHz), long distance can be 20 km, but on HF 500 km is not called long distance. So the meaning of long distance depends on the frequency band.

>You should distinguish between the actual polarization of the antenna and the physical appearance. depending on how you feed it, a very long horizontal wire can be sensitive to vertical or horizontal polarized waves.

>Though the equations for acoustical waves look similar to those of EM waves, the orientation of the field components is completely different. When you require a more specific answer, you should make your question more specific. I tried to give you a general answer for the various forms of radio wave propagation.

Now is XXI century. EM is a beautiful theory from XIX century. In Tetech products no incompressible massless fluid.
So the most specific and important question is:
How is frequency in receiving antenna. Is it doubled?

Best regards, and sorry for my style
S*

I sure am glad they finally fixed the simple calculator that Windows came with. It had a major bug in it that if I remember correctly if you substracted 3.1 from 3.11 you got zero. There were other numbers like that also.

I think Intel had to recall a bunch of chips because of an error in the math coprocessor part at one time.

Microsoft products are so full of 'problems' that if they ever put out an error free product it would seem to be a mistake.

In other words, an antenna acts a lot like a lossy
transmission line where the loss from the system
is radiation.

Here's a transmission line example using resistance
wire in a transmission line to emulate the losses
normally due to radiation in an antenna. Note that
the feedpoint impedance is around 35 ohms.

It is certainly popular to blame Microsoft with lots of things, whether they were responsible or not matters little.

Keep in mind that Microsoft did not 'design' the algebraic operator hierarchy for Excel, Excel was released with a claim of 100% cell formula compatibility with the then leading spreadsheet Lotus 123. (Microsoft's compatibility was so good, it was subject of a famous court case.)

It was much later that Microsoft conceived VBA and added it to their apps. IIRC, Visual Basic for Applications inherits its algebraic operator hierarchy from the BASIC language which was conceived around 1964 and enriched progressively.

The "intentional Microsoft bug" perspective looks like just prejudice.

Hello Szczepan,

You are right, charge is compressible. The charge that is required to
charge (for example) a sphere seems to break the coninuity equition as
is used for incompressible fluid in hydraulics.

Continuity in electromagnetism is regained by introducing the D-field
(dielectric displacement). The D-field is responsible for the
capacitive current in case of varying E-field.

Regarding frequency doubling. We can be lucky. Antennas and
propagation behaves in virtually all cases linearly. From linear
systems you might know that input and output frequency are the same,
so no doubling in frequency.

In case of non-linear parts in a system (for example a corroded
connector in an antenna cable that is used by two or more

transmitters, that may behave as a semiconductor), you might get so called mixer products (sum frequencies, harmonics, difference frequencies, etc).

If you would like to know more about EM-fields related to antennas and electronics, just start with classical EM theory. This is a solid tool, existing over 100 years and is used by many people with succes to predict behaviour of circuits and antennas. If this will change of today, I will close my business activities next monday.

Best regards,

Wim

Tom,

OK, I tried what you suggested. I put my loading coil midway up a 20ft vertical wire in the EZNEC model. I reduced the number of turns to lift the resonant frequency to 5.6MHz. EZNEC predicted that the magnitude of the current at the top of the coil would be 77% of the magnitude at the bottom.

Then I removed the coil in the model, replaced it with a straight wire containing an EZNEC lumped load, and adjusted that load for antenna resonance at 5.6MHz again. I needed +j1630.

Given the dimensions of the coil, the Corum calculator predicted a lumped circuit equivalent reactance of +j1573, and it predicted a current fall-off across the coil of 78%.

Did you make such a coil and measure its self-resonant frequency? The reason I ask is that I put the dimensions of an old coil I had (D=155mm,length=140mm,wire diameter=1.3mm,N=27 turns) into ON4AA's calculator and got a self resonant number of 7.4137 Mhz. When I measured it, though, it was 8.93 Mhz. Where did I go wrong? Maybe I entered the numbers incorrectly.

Tom,

I just modelled that coil in EZNEC and it was self-resonant at 7.5MHz
- very close to the Corum model prediction of 7.4137MHz.

Interesting that both EZNEC and the Corum are wrong and by the same
amount!

The self resonant frequency of a coil varies wildly
with the ground provided. What ground did you provide?
Perfect? Average? None?

Did you guys agree on the same ground plane? The self resonant
frequency of my 75m Texas Bugcatcher coil is very different
on my insulated wooden work-bench vs two inches above my GMC
pickup.

Cecil,

I tried mine above Perfect, Mininec Average, Mininec Salt Water. Self
resonant frequency was the same in each case.

>It is certainly popular to blame Microsoft with lots of things, whether
>they were responsible or not matters little.

Sorry. Bad choice of wording. From my perspective, a bug is
something that works in a manner that would be considered unexpected
or fails some form of standards compliance. The order and precedence
of operators was well established and includes no distinction between
negation and subtraction. I cannot imagine an example where a
distinction would be necessary (although I am willing to be
enlightened). Whether MS can be blamed for creating the distinction
is subject to some debate, however I doubt that MS can be praised for
creating it.

>Keep in mind that Microsoft did not 'design' the algebraic operator
>hierarchy for Excel, Excel was released with a claim of 100% cell formula
>compatibility with the then leading spreadsheet Lotus 123. (Microsoft's
>compatibility was so good, it was subject of a famous court case.)

Chuckle. I once made good money cleaning up a mess of old Lotus 1-2-3
and Symphony spreadsheets so that they would run under Excel. This is
for Excel 2003:
<http://office.microsoft.com/en-us/excel/HP051986941033.aspx>
There are also comparisons between other version of Excel and Lotus
1-2-3, but I can't find them. Different versions seem to have
somewhat different differences, which makes me wonder if Excel has
"evolved" their standards.

Quoting:
"Lotus 1-2-3 evaluates the exponentiation operator (^) before
the negation operator (ï¿½); Excel evaluates negation first."
So it is written, so it must be. Web pages are never wrong.

>It was much later that Microsoft conceived VBA and added it to their apps.
>IIRC, Visual Basic for Applications inherits its algebraic operator
>hierarchy from the BASIC language which was conceived around 1964 and
>enriched progressively.

Yep. Even standards change with time. It's the de facto standard of
the moment.

>The "intentional Microsoft bug" perspective looks like just prejudice.

Nope. I like Microsoft. If MS actually produced a bug free,
reliable, and fully functional product, I would be out of business. As
it stands, I expect to see considerable business from MS customers, as
new versions seem to introduce more features and functions, than fixes
to old bugs. After all, features and functions sell upgrades, but bug
fixes do not. 2.999999 cheers for Microsoft.

Incidentally, the company motto is "If this stuff worked, you wouldn't
need me". None of my customers have ever disagreed.

Close. See:
<http://en.wikipedia.org/wiki/Pentium_FDIV_bug>
for the details. Never mind that the fixed chips arrived after the
release of the next generation of Pentium processors, making
replacements for the older and slower chips a waste of effort. I had
several servers running the buggy Pentium 60 and 66Mhz chips.
Incidentally, they ran unusually hot and required extra cooling. I
applied to Intel for 3 replacement chips. By the time they arrived,
the server motherboards had been replaced with something better and
faster, so the new chips just sat around.

>Microsoft products are so full of 'problems' that if they ever put out an
>error free product it would seem to be a mistake.

I beg to differ. Microsoft bashing seems to be the national sport in
computers. Yet, they're the most successful computah company in
history. In addition, they did it without any ties to proprietary
hardware. They must be doing something right.

In my never humble opinion, 99% or more of what MS releases is done
correctly and works well. The 1% that doesn't is what we're all
complaining about. Because MS has such a huge number of products and
technologies, it's fairly easy to find bugs and problems. However, if
you compare the MS bug lists with those from other companies, the
ratio of bugs to product complexity is very favorable for MS products.
I have had to deal with OS's and apps from smaller companies. Methinks
they're far worse than MS. Also, there may be plenty to complain
about, but most products are sufficiently functional to be usable for
the intended purpose. What bothers me about MS is not the quantity of
bugs, it's their tendency to add features and functions instead of
fixing bugs. This tends to make the product grow into a bloated
monstrosity of useless features, with far too many semi-permanent
bugs.

Microsoft got so big the same way Walmart did. They put out a cheeper
product.

Digital Research had a much beter product when IBM produced the PC. I think
they wanted about $ 150 for it and MS wanted $ 50 for their product. They
basically put DRI out of business and also some other companies that had
their ideas incorporated in to the MS product line.

I'll tell you what, Cecil. If you'll test your coil, and
describe how you did it, I'll tell you what I did. Fair?
I know you're champing at the bit to claim my test setup was all
wrong and that I used standing wave current when I should have
been using traveling wave current, and all that, but you'll just
have to wait. I reported this in order to get you keyboard theorists
off your fundaments and start dealing with the real world. If you don't,
you'll forever be plagued by the nagging thought that I might be right.
Horrors!
73,
Tom Donaly, KA6RUH

(P.S. If you don't know how to test for a coil's self-resonant
frequency, you should go back to Texas A&M and ask for your money
back.)

Does not change in medium. But I am talking about the electrons in metal
kicked by impulses from the TWO sources in opposite phase. The electron do
not know which kick them.

it changes the intensity.
> As someone else pointed out, this is because EM waves are transverse waves

In EM a dipole radiate the ONE EM spherical wave. It is a math.
In reality a dipole is like a machine to produce the two monopoles which
radiate the TWO electric spherical waves.

Yes. But an antenna receive the doubled impulses (from the ends of the Hertz
dipole).

The simple instruments must distinguish the doubled frequency from the
second harmonics.

is used for incompressible fluid in hydraulics.

>Continuity in electromagnetism is regained by introducing the D-field (dielectric displacement). The D-field is responsible for the capacitive current in case of varying E-field.

So in your products is the dielectric displacement or compressed electrons?

>Regarding frequency doubling. We can be lucky. Antennas and propagation behaves in virtually all cases linearly. From linear systems you might know that input and output frequency are the same, so no doubling in frequency.

Try understand me. Your Hertz dipole emits electrc waves from the TWO ends (opposite phases). So the electrons in a receiving antenna are kicked twice more frequent.

>In case of non-linear parts in a system (for example a corroded connector in an antenna cable that is used by two or more transmitters, that may behave as a semiconductor), you might get so called mixer products (sum frequencies, harmonics, difference frequencies, etc).

Harmonics may be the reason that nobody have seen the Phenomenon.

>If you would like to know more about EM-fields related to antennas and electronics, just start with classical EM theory. This is a solid tool, existing over 100 years and is used by many people with succes to predict behaviour of circuits and antennas. If this will change of today, I will close my business activities next monday.

EM existing over 100 years and will be used the next as the "piece to teach".
Your business base on experiments.
Now You have the opportunity to make the most famous experiment in the history.
If the result will be null I will change my hobby.

Best regards,
S*

Computer Science 101 taught me that various computer compilers do not
always handle complex equations as I would expect and to break
equations down into steps using multiple lines of code. Compilers dont
even follow basic rules of mathmatics, if they did you would never be
able to code a = a + 1. They allow the programer to ASSIGN values to
variables and it is up to the programer to follow the rules.

The presence of a non linear medium is always required for frequency
doubling. The only part of the atmoshere that I know of that meets the
qualification is the ionosphere which contains plasma which could act
as a nonlinear medium. I suppose that if the signal were powerful
enough to produce ionization that a frequency could be doubled..

Tom,

You posted earlier "Why would anyone use MoM if there were a set of symbolic equations that would work just as well?"

We now have a situation where MoM (EZNEC) and a set of symbolic equations (Corum method) are predicting very similar SRFs.

"Verbal sparring" about measurement methods aside, I think it's important to try to understand what's causing the differences between the EZNEC/Corum value and the measured value. Of course it's possible that EZNEC is in error, but it seems odd to me that the Corum value (derived by a completely unrelated technique) would also produce the same erroneous value.

My EZNEC model had the coil 12" above Real Mininec ground, and connected to ground via a 12" vertical wire with the source in it. I simply looked for the frequency at which the source impedance was purely resistive. The SRF was relatively insensitive to the height of the coil above ground, and changing the ground type made no difference.

I wonder if that model is anything like your own test set-up, and if not whether the differences could explain the different SRFs we're seeing.

73,
Steve G3TXQ

> I know you're champing at the bit to claim my test setup was all
> wrong and that I used standing wave current when I should have
> been using traveling wave current, and all that, but you'll just
> have to wait.

That's not true at all, Tom. It's a trivial procedure
to use standing waves to determine the approximate 1/4WL
self-resonant frequency. But as with 1/4WL monopoles,
there is *NO 1/4WL self-resonant frequency* without a
ground plane or counterpoise and the quality of the
ground-plane/counterpoise has an effect on the self-
resonant frequency. Sorry, I don't have anything
approaching a perfect ground plane for 4 MHz.

I suppose one could use two identical coils and turn it
into a dipole but I don't have another 75m Texas Bugcatcher
loading coil.

Let me say once again: A 1/4WL monopole, all by itself
in free space is *NOT resonant*. After all, making guy wire
segments 1/4WL long is one way of breaking up their resonance.

We are not looking for super high accuracy/precision/resolution
here. Almost everything is an approximation because we don't
share exactly the same test environments. All I am after is
the technical truth - there's nothing personal involved.

Neither is a 1/4WL coil self-resonant all by itself in free
space. I don't know what Reg was thinking if he advised hanging
the coil from the ceiling without a counterpoise.

A traveling wave can be used to determine 1/4WL self-resonance
but it is a little more complicated than using an MFJ-259B
with standing waves. A load resistor minimizes reflections
while current probes are used to measure the phase shift through
the coil. When the phase shift is 90 degrees, that's the 1/4WL
self-resonant frequency.

> I'll tell you what, Cecil. If you'll test your coil, and
> describe how you did it, I'll tell you what I did. Fair?

1. I connected my 75m Texas Bugcatcher coil through about
a foot of wire to the bumper mount on my GMC pickup and
connected my MFJ-259B to the coax connector under the
bumper. I tuned for lowest impedance above 4 MHz. The
1/4WL self-resonant frequency was ~6.6 MHz. These

measurements were done and reported in March, 2006.

2. I used a tri-mag mount sitting on the hood of my GMC pickup fed through ~6' of coax. The 1/4WL self-resonant frequency was ~6.9 MHz.

3. I used a traveling wave on top of a wooden bench and found the frequency at which the phase shift through the coil was ~90 degrees. That frequency was ~7.2 MHz.

4. I modeled the coil with EZNEC and got some segmentation length warnings. EZNEC reported the 1/4WL self-resonant frequency to be 7.96 MHz.

The spread in the above frequency figures is about +/-8%.

Again Tom, the only thing I am after is the technical truth. If that is also what you are after, we should have no personal conflicts.

The above modeling was done using a traveling wave,
i.e. with the coil terminated in its Z0.

5. Using standing waves, i.e. no termniation, EZNEC
said the 1/4WL self-resonant frequency was 7.724 MHz.

The expression is an equation in mathematics and an assignment statement in programming. Two different concepts on two different contexts. The meaning of an expression can easily vary based on the context.

Consider 'x'; it can mean any of the following.
An abbreviation for a religious figure
An abbreviation for trans (xmit)
multiplication (2x3)
location of a pirate's treasure on a map
a kiss
one letter in a word

So, expecting a spreadsheet to follow the all rules of math is unrealistic.

The original post reflected confusion over operator precedence. Operator precedence is usually documented. Not paying attention to how a spreadsheet works is the user's fault. If there is doubt, parentheses can be added to make sure the calculations are carried out as desired. Verifying the calculations by hand is also a good idea.

They weren't always the biggest and baddest company in town. The
software departments of the major big iron makers were much larger
than MS in both manpower and revenue for most of the 1980's. Any one
of them could have produced a consumer grade operating system and
usable apps at the time and wiped MS off the map. They didn't because
they didn't believe that there was money to be made in essentially
consumer retail (i.e. off the shelf) operating systems and apps. They
also didn't know how to do it. I still recall the DEC Rainbow, where
customers were expected to buy pre-formatted floppies from DEC at
outrageous prices.

MS may also be very economical for OEM PC operating systems and
desktop apps. However, I note that a superior and totally free
operating system, while quite popular, has not produced much of a dent
in Microsoft's OS dominance. MS is also not currently the cheapest
OS. Apple OS/X Leopard retails for $130 while Vista Ultimate is $219.
>Digital Research had a much beter product when IBM produced the PC.
I think
>they wanted about $ 150 for it and MS wanted $ 50 for their product. They
>basically put DRI out of business and also some other companies that had
>their ideas incorporated in to the MS product line.

Yep. In 1981, CP/M-86 was better than PC-DOS 1.0. I was there.
CP/M-86 sold for $150. PC-DOS 1.0 sold for $60. Most of the early
IBM PC 5150 adopters bought both. I vaguely recall paying about
$4,000 for mine. $100 difference wasn't going to make a huge
difference.

CP/M-86 did more, but was more difficult to use. PC-DOS (er... QDOS)
was crude and simple. At the time everyone was waiting for DRI to

clean up the OS or at least make it more user friendly, while PC-DOS was treated as a temporary expedient so IBM could sell PC's that were suppose to run mostly apps in BASIC. Also note that PC-DOS included MSBASIC, while CP/M-86 would sorta run the older CP/M-80 apps. CBASIC came later. The IBM PC 5150 came with cassette BASIC in ROM. However BASIC in ROM was not easily accessible from CP/M-86. Within months of introduction, there were literally hundreds of new and ported apps for PC-DOS arriving at Computerland. Meanwhile CP/M-86 was still struggling with porting CP/M-80 apps. I had customers running some bookkeeping application on CP/M-86 well into the late 1980's. It was a struggle under CP/M-86. When they finally purged the machines and switched to PCDOS, things went more smoothly. For example, relinking the CP/M-86 operating system to install a new device driver was not my idea of fun. With PC-DOS, it was just adding a line in config.sys.

All this has something to do with ham radio antennas, but the connection escapes me for the moment.

It is proposition by Maxwell. Do not verified to now.
Electric waves have more chance.
For some it is obvious that in space may be the only one mechanism.
Aepinus proved that gravity and electrostatics are the same. (the
coefficient in the Coulomb equation has the tree different values)
Ampere proved that the magnetism is an ilusion.
So no place for the proposition.

It varies by position. At the front of a string of arithmetic
operations, it's multiplication. In between the terms of an equation
or values, it's subtraction. This article covers some of the problem:
<http://www.physicsforums.com/showthread.php?t=109516>
Humans can usually make the distinction by context. Too bad computers
can't do the same.

>Either way Microsoft Excel implements it incorrectly because in either

>Excel.

I can sorta tolerate perpetuating mistakes. However, Microsoft's
attitude toward precedence operations reeks of damage control and of
trying to create a secondary standard by sheer number of users. The
first step to fixing the problem should have been to admit that they
were wrong. That never seems to have happened.

I am not fluent in English. So try to understand.
The electrons (they have mass and inertia) colect in one end and next
disappear. It is the one cycle. Next they travel to the other end. It takes
time. So in space are send the two signals.(in one your cycle).
In the same time 9Your cycle) the current flow to and fro.
In unverified EM the current cause the spherical wave. In reality the ends.
Only Your simple measurements can verify it.

Nope. It was Borland versus Lotus over the look and feel of the
spreadsheet.
<http://en.wikipedia.org/wiki/Lotus_v._Borland>

There was also Apple versus Microsoft over the Windoze look and feel:
<http://en.wikipedia.org/wiki/Apple_v._Microsoft>

However, none of this had anything to do with the operation of the
spreadsheet. That's because the original spreadsheet operation was
defined by Visicalc:
<http://en.wikipedia.org/wiki/Visicalc>
Visicalc and spreadsheets were NOT patented and therefore not the
subject of litigation over function or operation:
<http://techdirt.com/articles/20050812/1835229_F.shtml>

Fun reading on who sued whom:
<http://en.wikipedia.org/wiki/Apple_Inc._litigation>
<http://en.wikipedia.org/wiki/Microsoft_litigation>

My Super Antenna MP-1 blew over today, and the plastic thumbscrew broke off. Does anyone know where I might find such a part? I've written to the guy who makes them, but I've tried that before when other parts have broken, and he doesn't respond. Any help would be appreciated.

Hi,
Let me help you with your problem.
You mentioned a cycle which you know is equal to a period or
occillation of a radio wave. Let us say that an antenna charges up and
then radiates ie half the time or occillation for each action. Now you
have decided to apply power to a half wave antenna asnd not a full
wave antenna that is occupied in some action all of the time period.

Now you have to decide what your half wave antenna is going to do. Charge up only and let the power leak away or radiate without having any power!
What you have to do is to imagine a radiator as a tank circuit where you have two energy storage areas, a inductor and a capacitor and for the mom ent free from losses.
Thus the energy loads up the inductor which then empties into the capacitor which in turn empties back into the inductor e.t.c Thus only one charge is supplied and no more since the same charge is really not being let go!
This is seen as perpetual motion which is an impossibility. Thus if energy is going to be used it will only be expended for half a cycle and then the circuit recharges for the next cycle. Now you should be able to see that a half wave antenna is only capable of working half the time so in no way can you be applying a doubling of frequency motion when you only have a half wave antenna to work with. So S* go back to your study but first replace your half wave antenna and re think things out with a full wave antenna in loop form with a tank circuit in mind and when you have all things in place
substitute your half wave antenna and determine what this does to you tank circuit and radiation.

Lotus did not like Excel's compatibility with 123, and targeted specifically the / command key in Excel as knocking off Lotus' IP. The / key was removed in later versions, and IIRC the help sections that were designed for 123 users.

Yes, those were the days of people suing people for too much looking and feeling. Ashton Tate were right up there in the DBase lookalike race, but pretty much everyone was into it, and just recently we hear that SCO didn't really own the rights to their flavour of UNIX.

The early versions of Excel did have very good compatibility. One cannot say that about OpenOffice, last time I looked it did not support VBA, and I use VBA to a great extent in many of by spreadsheets, so not being prepared to port and test all the content, the brave new OpenOffice is for beginners who don't have a large investment in VBA code.

Irrespective of the heritage of these things, it is an inexperienced and naive programmer who doesn't check the operator precedence for the language environment being used.

If he doesn't answer his snail mail, try the phone:
916-434-9936
Hint: You might have problems getting anyone's attention just prior
to the Dayton Hamvention (May 15-17)

I don't have an MP-1, but if you measure what's left of the nylon
locking screw, and determine the thread type, you should be able to
find something suitable at your local hardware store. If not, there
are plenty of nylon hardware vendors online. However, buying just one
screw might be rather expensive. Worst case is to buy a solid plastic
rod of the proper diameter, and use a threaded die to thread a
replacement screw. Use a radio knob for the handle.

What cheaper product was that? After CP/M and similar OS's died decades ago, the earlier PC-DOS and later Windows were the only commercially distributed OS's available unbundled from hardware. Thus, Windows really had no significant competing product to be cheaper than. The hardware to run those Microsoft OS's was occasionally cheaper, but Microsoft had no great influence in that.

The presence of anything at all near the coil should lower its resonant
frequency. Even the measuring apparatus should have an effect. I think
it would require very careful planning and implementation to find an
exact resonant frequency. You'd have to ask Richard Clark how to do it
if you wanted high accuracy. I'm unwilling to find fault with either
Corum or EZNEC at this point. Making accurate models can be just
as hard as making valid experiments, and I wish you luck working with
your models. I do urge you to make a coil to test your results against,
though. It isn't difficult, and with a little help from some of your
fellow experimenters, you should get results that are very close to
being meaningful.

SCO Xenix. Microsoft started Xenix *BEFORE* IBM arrived and bought MS BASIC. IBM wanted an operating system, so Bill Gates sent them to DRI for CP/M. When IBM and DRI couldn't agree on anything, IBM came back to Bill Gates. Bill knew that Tim Paterson of Seattle Computer Products had something called Q-DOS (quick and dirty operating system). QDOS was suppose to be a temporary kludge while waiting for DRI to deliver CP/M-86. PCDOS grew so quickly, the Xenix was put on the back burner for a while. Eventually, Xenix was licensed to SCO, IBM, and others. It was far more expensive than PCDOS or MSDOS but also far more useful and reliable. For example, Xenix had support for RAM above 1MByte, long before EMS/XMS arrived for PC-DOS. I still have customers running SCO Xenix 2.3.4. Xenix also had a rather fanatically loyal following. When SCO tried to promote Open Desktop as a Xenix replacement and proceeded to try and kill Xenix, the dealers almost rebelled. It took over 10 years for Xenix to fade away, mostly because of simple neglect.

There were plenty of other Unix v.7 ports by other companies at the time (long before Linux).
<http://www.levenez.com/unix/>
For example, IBM and DEC both sold Venix on their low end hardware in 1984.

There were also a mess of general purpose non-Unix and non-DOS operating systems (not tied to hardware) released over the years. Minix, GEM, GEOS, QNX, Netware, OS/2 are the ones I can recall.
<http://en.wikipedia.org/wiki/Operating_systems_timeline>
Most of the general purpose OS's were roughly in the same price range as MSDOS. Therefore, price was not a major factor in their demise.

The very first operating systems were either DR or MS products. MS was
cheeper than the DR product.
Then MS incorporated softwear like Double Space (big lawsuit over that so
win 3.11 came out) Internet explorer is standard now. Pushed out many
other internet programs.

That's my experience. Conversely, the farther away from the
coil the ground plane is located, the higher the self-resonant
frequency. The location of the ground plane has a significant
effect on the self-resonant frequency of the coil.

Hi Steve,

OK, I'm wondering now exactly what "Corum calulator" you are using
that predices "a current fall-off across the coil of 78%." The
inductance calculator on the HamWaves website that I thought we were
talking about doesn't seem to say anything about "current fall-off" in
coils, though perhaps I'm missing it.

Cheers,
Tom

>boxes.

Not exactly. Gary Kildall and others wrote some simple games for the
4004 that ran on what later became a development system. They tried
to get Robert Noyce to sell it. Nope. Noyce thought there was more
money in digital watches which Intel never produced. At the time
(1971) nobody had the slightest idea of what to do with a general
purpose microprocessor. Even the dynamic RAM business was almost an
accident when Intel discovered they couldn't sell micros without the
necessary glue chips and memory. In it first few year, Intel didn't
have the slightest idea what they were going to manufacture.

Somewhat later, he tried to hang some storage onto an MCS-4 chipset
demo board with limited success in adapting his PL/M operating system.
That morphed into CP/M in order to distinguish it from the Intel
effort. There's probably something on the topic in the book "Fire in
the Valley". Worth reading methinks:
<http://www.amazon.com/Fire-Valley-Making-Personal-Computer/dp/0071358927>
Ouch. It seems to have become a collectors item. I think I paid $10
for my paperback edition. (Someone stole my hardback edition). At
least the used copies are affordable.

>Those high-caliber software guys moved from Silicon Valley
>to Digital Research over on the Pacific coast and the rest
>is history. Intel could have been the behemoth supplying
>the microcomputer chips, operating system, AND the
>computer box.

Yep. I'm not sure they could have handled the rapid growth in too
many areas. At the time, Intel's gross was growing about 40% per
year, which is about at the limit of which they could fund growth with
revenue and loans. To diversify into adjacent areas would have
certainly been opportunistic, but would have drawn resources better

spent on cranking out chips. Diversification through acquisition is
safer. Craig Barrett tried unsuccessfully to diversify the company,
while Paul Otellini sold off divisions and diversions. Intel does
well with its core business, but not much elsewhere. Remember the
Santa Clara bubble memory division (with the giant plastic bubble in
place of a picture window in conference room)? That's where the term
"economic bubble" may have originated.

It's interesting to note that the general purpose operating systems
that were *NOT* tied to a hardware platform have survived far longer
than those attached to a manufacturers hardware. Apple OS/X is an
exception in that it's 75% portable (Mach) Unix, and about 25%
proprietary Apple. It would not have survived in it's original MacOS
form. Well, OS/X is a somewhat portable operating system:
<http://gizmodo.com/5156903/how-to-hackintosh-a-dell-mini-9-into-the-ultimate-os-x-netbook
>

All this has something to do with antennas, although the connection
currently escapes me.

Hi Tom,

I should have been more explicit.

I took the "Axial Propagation Factor" (4.372 rad/m) figure which was
given by the HamWaves calculator and multiplied it by the coil length
(155mm) to find the effective electrical length of the coil (38.83
degrees). Then I took cos(38.83)=0.779 as the fall-off in current
across the coil.

>Hi,
>Let me help you with your problem.
>You mentioned a cycle which you know is equal to a period or

occillation of a radio wave. Let us say that an antenna charges up and
then radiates ie half the time or occillation for each action. Now you
have decided to apply power to a half wave antenna asnd not a full
wave antenna that is occupied in some action all of the time period.
Now you have to decide what your half wave antenna is going to do.
Charge up only and let the power leak away or radiate without having
any power!
What you have to do is to imagine a radiator as a tank circuit where
you have two energy storage areas, a inductor and a capacitor and for
the mom ent free from losses.
Thus the energy loads up the inductor which then empties into the
capacitor which in turn empties back into the inductor e.t.c Thus only
one charge is supplied and no more since the same charge is really not
being let go!
This is seen as perpetual motion which is an impossibility. Thus if
energy is going to be used it will only be expended for half a cycle
and then the circuit recharges for the next cycle. Now you should be
able to see that a half wave antenna is only capable of working half
the time so in no way can you be applying a doubling of frequency
motion when you only have a half wave antenna to work with. So S* go
back to your study but first replace your half wave antenna and re
think things out with a full wave antenna in loop form with a tank
circuit in mind and when you have all things in place
substitute your half wave antenna and determine what this does to you
tank circuit and radiation.

Our problem apply to the original Hertz experiment. See:
http://people.seas.harvard.edu/~jones/cscie129/nu_lectures/lecture6/hertz/Hertz_exp.html

There is: "According to theory, if electromagnetic waves were spreading from
the oscillator sparks, they would induce a current in the loop that would
send sparks across the gap"

In EM waves are produced by the current (oscllator sparks in the Hertz
apparatus). One cycle is completed when the current flow to and fro.

But there is possible the other theory. Electric waves are spreading from
the ends (plates or big balls in Hertz apparatus). Now we know that
electrons have mass and are compressible. So at the ends appear and
disappear the huge charges. In that case an electric impulse is send when
the current flows to (from one end) , and the next when the current flows
fro (from the other end). So in one EM cycle are the two electric cycles.
So the frequency is not doubled. The electric is twice more.

It seems that at long distances receiving antennas should work better at the
electric frequencies.
BTW, what exactly means "Luxembourg effect" (Brian wrote: " e.g Luxembourg
Effect; so
doubling is possible.")?

A 1/2WL dipole is a standing-wave antenna. Believe it
or not, ~80% of the steady-state energy on a 1/2WL dipole
is not radiated, i.e. as far as total energy is concerned,
radiation is a secondary effect. Energy is traveling in both
directions at the same time on a standing-wave antenna. At
the tip of the antenna, the two energy flows are equal. At
the feedpoint, the reflected wave is only ~20% down in
energy level from the forward wave - the reflected voltage
and current are only ~10% down from the forward voltage and
current. The feedpoint impedance of a 1/2WL dipole is the
result of superposition of the forward and reflected waves.
The Z0 of a 1/2WL dipole using #14 wire at a height of 30
feet is very close to 600 ohms.

Interesting. W8JI's coil through which he measured a 3 nS
delay was 100t, 2" dia, 10" long, #18 wire.

http://www.w8ji.com/inductor_current_time_delay.htm

Converting everything to metric and entering the data into
the HamWaves calculator at 4 MHz, yields a calculated delay
of 21.5 nS through the W8JI coil and a VF of ~0.04 at 4 MHz.

So which are we to believe? W8JI's measurements or ON4AA's
calculator. There's a 7x difference between 3 nS and 21 nS.

Well, I have a 1/2 wave inverted L for 160 that I use with a remotely tuned L network on 160, 80 and 40. The matching network sits on top of a 6 inch well casing that goes down 90 feet and is grounded to that. That was initially my only ground. The 160 meter impedance was 2600 Ohms and 1800 on 80 and 700 on 40. I later installed a counterpoise under the horizontal portion of the antenna, 160 feet at 10 foot elevation. Of course, I didn't notice any change in operational reports or anything, but the feedpoint impedance went to 1900, 1200 and 450 Ohms respectively. I suppose the earthworms think that global freezing is taking place, but no other effects noted. It's been a very effective LF antenna for over 20 years both ways.

You are to speedy. Look at the original Hertz experiment:
http://people.seas.harvard.edu/~jones/cscie129/nu_lectures/lecture6/hertz/Hertz_exp.html

There is: "According to theory, if electromagnetic waves were spreading from
the oscillator sparks, they would induce a current in the loop that would
send sparks across the gap"

In EM waves are produced by the current (oscllator sparks in the Hertz
apparatus). One cycle is completed when the current flow to and fro.

But there is possible the other theory. Electric waves are spreading from
the ends (plates or big balls in Hertz apparatus). Now we know that
electrons have mass and are compressible. So at the ends appear and
disappear the huge charges. In that case an electric impulse is send when
the current flows to (from one end) , and the next when the current flows
fro (from the other end). So in one EM cycle are the two electric cycles.
So the frequency is not doubled. The electric is twice more.

Does your measurements distinguish radiation from the spakrks from that from
the plates?

Hi Steve,

OK, so I suppose you are assuming that the current distribution will follow a cosine along electrical degrees of your antenna, with a maximum at the base/feedpoint. If that's the case, then would you not account for the bottom 10 feet of wire, about 20.5 electrical degrees? If I do that and assume 1 amp at the feedpoint, I should see about .9367 amps at 20.5 degrees and 0.5101 amps at (20.5+38.83) electrical degrees. 0.5101/.9367 would then be the ratio of currents between the ends of the coil, and that's 0.5446, only a 45.54 percent fall-off.

In fact, it seems to me that the idea of cos(38.83 degrees) = .779 would imply a fall-off of 22.1%... and that tells me that perhaps I'm still not understanding your model very well. Maybe you are NOT assuming the current along the electrical degrees of the antenna, up from the feedpoint, will have a cosine distribution. At this point, I have to say that I'm just not at all sure what your model really is. Perhaps you are making different assumptions about the current distribution...

Also, if you still have the model around, try adding a top hat to the upper wire. For simplicity, you can just use a simple "T" structure, where the top horizontal wire is, say, five feet long total. With such a configuration, what's the current distribution along the radiating element going to be?

Of course, what I'm suggesting here is that one must be careful to test ones models at corner cases before putting too much faith in them, and even then, one must always be wary of cases where the model may go awry.

Cheers,
Tom

2999. FS E.F. Johnson Matchboxes/Antenna Tuners

I have for sale several E.F. Johnson Matchboxes/Antenna Tuners: 1. Model 250-23-3. This is the small 275 watts AM tuner(good for over a KW PEP SSB). It has the built in SWR Meter and outboard Coupler. Nice shape. Price is:$135; 2. Model 250-23. Small tuner as above but without the Meter and Coupler. Good shape. Price is:$85; 3. Model 250-30. This is the Large KW AM tuner(good for much more on SSB). This model does not have the Meter or Coupler. It is in very nice shape. Price is: $275; 4.Model 250-30-3. Large KW AM model as above, but it has the Meter. Requires Coupler not supplied. This one works but is rough cosmetically. Digital pictures available. Price is $135. Shipping is FREE within CONUS for all tuners. Thanks, Charlie Hugg, K5MBX

Radials basically serve the purpose of improving the apparent conductivity of the soil at the base of the antenna (e.g. less loss than a simple stake in the ground).

A goodly portion of the loss of an antenna like a vertical is in the IR losses of the RF current flowing in the surface of the soil (where "surface" depends on the RF properties of the soil, skin effect and all that).

So, burying deeper probably doesn't help this (e.g. you want to improve the conductivity at the surface).

I have seen a few antenna modeling programs mentioned here.
Is there any concensus within the group on which one is
better to use? Any that are free?

- Consider that I am pretty much a beginner when it
comes to antennas.
- I am intrested in modeling receiving antennas in the
UHF and VHF bands.
- My big point of couriosity right now is reflectors.
I want to see the effects of various wires, rods, screens,
foil, etc.

I suppose that I could pepper the group with questions.
But, at some point it's best to do my own damn research.

This is a good assumption for horizontal 1/2WL thin-wire
dipoles as presented by Kraus. It doesn't seem to be valid
for loaded vertical antennas where there is an instantaneous
phase shift at the impedance discontinuities. There is a
definite change in the slope of the current profile at
such boundaries.

And there is the nagging current bulge in the loading coil
causing a rise in current in adjacent turns. Normally a
current maximum would indicate a purely resistive impedance
but that doesn't seem to be the case inside a loading coil.

Years ago, I gave up on the current cosine argument for
loaded mobile antenna current in favor of loading the
coil with its characteristic impedance and using traveling
wave current to measure the electrical length of the coil.

Hi Steve,

I don't often drop into this side-thread as the topic had drifted into
a stagnated intellectual backwater.

On this and one prior posting by you:
>On Sat, 9 May 2009 13:56:31 -0700 (PDT), google@karinya.net wrote:
>>OK, I tried what you suggested. I put my loading coil midway up a 20ft
>>vertical wire in the EZNEC model. I reduced the number of turns to
>>lift the resonant frequency to 5.6MHz.

I note how little Corrum really has to offer when you had to take the
same:
>effective electrical length of the coil (38.83 degrees)
and change it (to the same effective electrical length? I think not.)
to fit the same available wire, at the same specific frequency - only
at a different height along the available wire.

By my quick read on the stale crisis of current "fall-off" and proving
Corum by EZNEC; it seems quite apparent that EZNEC (the authority) is
driving the coil requirements which are then force fitted by Corum's
inappropriate application.

After all, Corum says nothing of:
1. Application;
2. Base loading;
3. Mid or Top loading;
4. Stinger selection;
and yet all solutions seem to derive from their math with the elegance
of an ad-hoc "missing degrees" provision (that is quickly discarded as
shown above when current becomes the focus).

Corum DOES say that the formula is only applicable for certain
constraints which I note are NEVER observed in the application nor the
breach. All of the commentary proceeds through equation (32) when
every argument is an instance of equation (31).

How much are you willing to accept of that paper (which is another way of asking how much you are willing to discard)?

I will ask one ace-buster question that I expect no one will answer:
Show me the computation for M (= tau ï¿½ a)
which would be appropriate for the NON-quarterwave resonance of the coil in question at 3.85 MHz.

For extra credit:
1. What is the wave number, k for 3.85 MHz?
2. What is the phase velocity for the original (not changed) coil?
3. What is tau for the original (not changed) coil at 3.85 MHz?

Yes, this is intimidating to ask; but seeing there are so many authorities on Corum; and that these considerations would have been done by the authors themselves; then their solutions must reside somewhere in notes or as marginalia for quick reporting (or could be summoned up through running through the same math as before).

Hi Tom,

Thanx for the flowers. In point of fact, inductor and capacitor
standards are shielded. They are three terminal devices. To remove
the effects of the shield you drive it at the same potential (which is
to say the shield is floating with respect to everything/one around
it).

For the practicality of things, Reggie was never very far off the mark
and you following him as an exemplar is suitable to other's inventions
of proximities that have no defining moment in their references.

I can well guess the remainder of your method as it was well defined
in most Ham manuals (derived from conventional EE methods) when I read
up on it 40 odd years ago. If Cecil every gets over this intellectual
pebble in the path, please quote it so that I can see how much strain
that ascent took.

Tom,

Firstly, I'm guilty of a "sloppy" choice of words. Whenever I've been using the phrase "drop off in current" I've meant the current at the top of the coil as a percentage of the current at the bottom. So when I've quoted 70% the current will have reduced by 30%. Apologies!

Secondly, you're testing the limits of my understanding with the overall current distribution from base section, through the coil, to the top section. However I think the point is that you can't simply "add electrical degrees" through the various sections when the characteristic impedances of the sections are so disparate. That was Cecil's point in the very first posting. We also know that, as expected, summing the "degrees" for the three sections gets nowhere near a total of 90 degrees, so clearly you can't assume a cosine distribution that is contiguous across all three sections.

I'll investigate what happens with a "top hat".

What you don't seem to realize is that the loaded
antenna can be assumed to be lossless in free space
with a 4-wire radial ground plane and the E-fields
and H-fields are within 10% of their real-world
values, i.e. you are complaining about relatively
small secondary effects.

As far as conditions on the antenna are concerned,
you are complaining about relatively small
secondary effects. Of course, there are large
effects on radiation and ground loss, but those
items are not the subject of this discussion.

Hi Richard,

I wont even attempt to answer the "intimidating" questions - they're
far too tough for me!

But just a couple of comments:

1) The change in coil size when I swapped from a base-loaded to a mid-
loaded model was nothing more than a convenience to reduce the total
number of segments and reduce the computation time. It was not borne
out of any electrical considerations, so please don't read anything
more than that into it. In retrospect it was a silly thing to do
because it has probably introduced a "red herring".

2) You suggest that the Corum method has little utility. However, the
inductance calculator based on the method appears to give usefully
accurate predictions of "equivalent lumped reactance" and SRF (jury
still out on that one). If that calculator was not available, it seems
to me that designing a coil for something like a mobile whip loading
application would require tedious iterations of the helix generator in
EZNEC.

>send sparks across the gap"

If? If is wrong.

>In EM waves are produced by the current (oscllator sparks in the Hertz
>apparatus). One cycle is completed when the current flow to and fro.

You say this often, but it adds nothing important.

>But there is possible the other theory. Electric waves are spreading from
>the ends (plates or big balls in Hertz apparatus).

This is not ANOTHER theory. Your first "If" is not a theory at all.
It is an incorrect statement surrounded by poor writing. It is like
this next statement:

>Now we know that
>electrons have mass and are compressible.

Nonsense.

>So at the ends appear and
>disappear the huge charges. In that case an electric impulse is send when
>the current flows to (from one end) , and the next when the current flows
>fro (from the other end).

Nonsense.

>So in one EM cycle are the two electric cycles.

Nonsense.

>So the frequency is not doubled. The electric is twice more.

This is either very poor English, or more nonsense.

>Does your measurements distinguish radiation from the spakrks from that from
>the plates?
>S*

Of course they do. More the question: can you measure them too? If you cannot, then this explains the nonsense.

Then use the one most mentioned among a group of people who regularly exchange their work and discuss their results. I won't be coy, it is called EZNEC. However, that is not the last word in recommendations.

>- I am intrested in modeling receiving antennas in the
>UHF and VHF bands.

Receiving and transmitting are merely the difference of the PTT button.

>- My big point of couriosity right now is reflectors.
>I want to see the effects of various wires, rods, screens,
>foil, etc.

This would demand a modeler with the ability to work with a large number of "segments." Don't go there until you can build a dipole and understand how it works in free space, over ground, and across three orders of frequency change. If you do this first on a simple, cheap or free modeler; then you will be better educated in what you need in a tool, and how much to spend if it comes to that.

>I suppose that I could pepper the group with questions.
>But, at some point it's best to do my own damn research.

Good for you for saying that; but rest assured you still will pepper the group with questions. This is not a past-time that fades over the weekend.

Tom,

One further puzzling feature:

When I look at the EZNEC currents in the bottom 10ft of my 20ft mid-loaded model there is *NO* current reduction from bottom to top: 1A at the bottom and 0.99996A at the junction with the coil. So no evidence of a cosine shape starting at the bottom.

Brain hurts - time for bed!

73,
Steve G3TXQ

In many center-loaded antennas, the current increases
from the feedpoint through the base section to the
bottom of the coil. Converting that non-cosine current
into an equivalent cosine current with the proper
phasing/delay may take some doing. I don't know of
anyone who has accomplished that feat so far. However,
it would be a very useful algorithm.

One way to do such would be to compare the current in
an ideal transmission line with the current through
the loading coil as reported by EZNEC.

Hi Steve,

That's OK. Even the Corums didn't answer them and it accounts for the rather thin material being leveraged into the new-age science we get discussed here.

>But just a couple of comments:
>
>1) The change in coil size when I swapped from a base-loaded to a mid-

It is only a "red herring" if you were intent on mischief. If you were, you are surrounded by accolytes better versed than you.

However, silly or otherwise, it doesn't answer the intent of the question. The coil size doesn't change by segment count, but by wire count, diameter, turns per inch, length. If any of those changed along with number of segments, then you haven't really done anything but compared two arbitrary designs to discover they don't match.

What profit in that? (and why did we branch the topic?)

Or they do!

What is to be learnt that this illustrates? (and why did we branch the topic?)

>2) You suggest that the Corum method has little utility. However, the

>to me that designing a coil for something like a mobile whip loading
>application would require tedious iterations of the helix generator in
>EZNEC.

That is an objection, not a reason, and very far from a discipline (Corum vs. the world).

What I asked is, if you use Corum (against its provisos) to obtain a value (fully acknowledged to be erroneous when the provisos are met, they aren't), for applications that contain considerations that the Corums do not contemplate, AND you use another tool to validate the answer - why is it that you wonder on the happenstance of correlation? This puzzlement is enough to suggest Corum may bring grief unexpectedly. Does this make the muddy prospects of its utility clearer?

Still and all, this side-topic is still stuck at the gate to your buying the farm. Skip the coyness by subscribing to Corum and let Cecil introduce you to new vistas where these missing degrees will suddenly emerge again. When that happens, all that is required is that you suspend your doubt that if that coil at the base of a fixed height antenna were moved, it would fulfill resonating that fixed height antenna with the same number of Corum "electrical degrees" in migration. If Corum "electrical degrees" have to be augmented with appended theory (diluting the original's importance to elevate the appendix, as it were); then I would ask again: Does this make the muddy prospects of its utility clearer?

Yes, Steve, I can full well appreciate that you wouldn't necessarily expect the same coil to resonate the same, short antenna every where you happened to place that coil along its fixed length. But this side-thread isn't going to get any traction until you go with Cecil's flow (which will undoubtedly swirl into another stagnation at this point of my observation).

For what it's worth, I've been using a coil program for quite a few years now that is able to calculate the performance of a coil based on a helical transmission line model. It was developed out of travelling wave tube theory. It turns out I discovered a bug in the program and reported it to the author, who very kindly corrected it. I've come to trust it to come up with answers that are very useful in an engineering sense. I would not expect it to tell me inductance or other parameters (e.g., first parallel self resonance and first series self resonance) accurately enough to be used as a precision lab standard, but that's not what I use the program for.

When I became aware of the HamWaves web page, I was curious about how well its answers compared with the ones I'd become used to trusting. They do differ a little, but again, for what I do with them, I trust them both. Either one will provide results I can use to wind a coil for a filter and know I won't have to much to adjust the coil to being "right on." And in fact, I also found a very small bug (or at least an anomaly or inconsistency) in the HamWaves calculation, and reported that to Serge, who likewise very graciously acknowledged it and who I

believe corrected it.

So I'd strongly support your thought that the HamWaves calculator provides useful results. Understand that they won't be perfect, but also understand that you may have trouble making measurements accurate enough to know how much they are in error. But for almost everything I do with coils, what I care about is whether the filter or tank circuit or antenna in which the coil is used actually works like I want. My trust in these programs comes from being able to build a lot of filters over the years that all work like I designed them to work, with very little effort to tweak the coils I built per the programs' predictions. I'll adjust my expectations if I ever find cases where the programs lead me astray.

Cheers,
Tom

So who are we to believe? W8JI's 3 nS delay measurements through
a large 75m loading coil, or the HamWaves 21.5 nS prediction?

Using standard stub theory and transmission lines,
I have shown how moving parts of dual-Z0 stubs from
one place to another requires a change in the length
of parts of the stub.

Why do you have such difficulty applying this standard
transmission line theory to loading coils? Could it be
that you are dismissing technical facts because you
are incapable of understanding them? If so, you have
lots of company down through history.

4nec2 also has it's adherents as a front end.

Both are basically good front/back ends to the core NEC engine.

>
>> - I am intrested in modeling receiving antennas in the

Good.. so you're not looking for handling dielectrics, soil, etc.
Mostly free space models of purely conductors.

Remember that NEC works best with things described as collections of
wires (of various diameters, etc.).

It's not so hot with things like patches, dish reflectors, etc. (except
by modeling them as grids of wires).

I'm sorry, but i don't have a spark transmitter, those have been rather illegal for many years because of the extreme bandwidth and noise they generate. I use a nice clean sine wave so there is no harmonic generated. if you use a spark generator there will be many harmonics, but they come from the waveform being generated.

Hi Richard,
In point of fact, I just used a dip-meter-frequency-counter
combination to see if I could get somewhere near the results that
ON4AA's calculator suggested. Later, I cut the coil at its center point,
attached a cheap antenna analyzer there and looked for a frequency of
least impedance. The dip meter indicated about 8.93 Mhz and the analyzer
indicated 8.98 Mhz. I consider the closeness of the two readings to be
pure accident. However, they do reinforce each other in leading me to
believe that the Corum calculator has some serious deficiencies. Serious
enough, that those who claim its correctness should do some practical
investigation into its merits in order to spare themselves the jibes of
their more analytical brethren.

And those days are gone, but not the way you'd think. Current Ericsson cell switches in Europe run ERLANG, one of the successors of PLEX, and they are getting 11 9's or better.

ERLANG is a very interesting language and has been released as open source. See

http://erlang.org/

Hi Tom,

I wouldn't have expected any other method based on your "tease."
It answers the need for lightly coupling which responds to your
admonition of not presenting disturbances to the measurement. About
the only variation to this would be in how you could lighten up the
coupling further. I don't see Cecil struggling for the low fruit
here, so I'm not expecting to see him make this into a rum punch.

>Later, I cut the coil at its center point,

Pursuing an alternative method helps validate them both, another
hallmark of good bench work. That Steve finds two values that
correlate through software begs the question of what parameters were
used. As such, two in silicon against two at the bench - something's
got to give. The differences are not deep in the decimal places.

>However, they do reinforce each other in leading me to

Tom subscribes to Corum (if I read his posts correctly), to the extent
of his needs. That seems sufficient for me, but it does not attach a
proof to the conjectures and it doesn't serve the glaring points by
the authors that their model works only with resonating coils (if I am
reading them correctly), or unless you derive your own M factor (no
one stepping up to the plate for that suggests they have no deep
interest in the topic). They allow roughly 10% error as it stands,
and I observe debates trying to leverage 5% positions.

Center to center. Or top to top...
What I actually did was to make a mark on the dowl at
1 inch and 8 inches from the end. Then mount the bowties
at those locations. Lineing up the marks with the bottom
of the bowtie clip.

Quickly then.

ERLANG is a language made for highly reliable systems control.

It will run the same cooperative code on very different systems.

It will allow fully transparent failover between systems.

Programming to handle failover with no loss of control state or data
stream is central to the language design.

The systems using this for cell handling are claimed to be able to
handle the primary having catastrophic failure, switching to the
secondary, and not dropping a single byte of the stream.

The language was originally designed for telecom, but has had more
generic capabilities added.

I am not an expert nor even a newbie on this. I saw a a one hour talk
on it last late summer. I was expecting a presentation on statistics
and got something completely different.

I am getting back into programming just to tune my mind up, and this is
one of the languages I will be including.

Hi Tom,
A testimonial from you goes a long way toward building some
trust in ON4AA's coil calculator. I was concerned because I haven't seen
much in the way of empirical data to substantiate the claims made for
it. I would have thought that the creators would have at least provided
a link to some data, or to a description of their own coil-making efforts.
73,
Tom Donaly, KA6RUH

Testimonials do not make technical information true
or false. This technical information has been available
for the past 5-8 years.

Sorry, first things first. I am a newlywed (Feb. 28) and
all my equipment is still packed in boxes after squeezing
into a new QTH. I am presently not even on the air.
I reported my experimental results years ago and was
satisfied with the results.

Hint: My experiments do not affect (or effect)
technical facts. Neither do your beliefs or anyone's
testimonials. Those technical facts have been staring
you in the face for 5+ years now. What have you been
doing for the past 5 years - anything except ad hominem
attacks?

Well, I'm flattered, but I'd invite you and anyone else here who might build coils for practical purposes to report back how that calculator, or any other, worked for them. The homebrew newsgroup might be a better place to do that. And if you think you've come up with a situation where any calculator seems significantly in error, don't be shy about reporting it to the author or maintainer of the calculator. I've found most to be quite happy to hear about bugs, especially if they are well documented, if they are told in a nice way.

I tend to not push the limits on coil calculations, because I know that I'll get the best volumetric efficiencies with coils over a relatively small range of diameter-to-length ratios, and for air-core solenoid RF coils used between a couple MHz and a few hundred MHz, I know what physical size I'll need for any particular required Qu. So you very well may find cases of more extreme D:L ratios where a calculator I've learned to trust isn't so hot -- and honestly, I'd love to know about such limits.

Cheers,
Tom

Cheers,
Tom

Hah. I don't think there's anything this group agrees upon. There
are often as many opinions as there are participants.

>Any that are free?

Yep. I use 4NEC2 (because I'm cheap). Lots of examples included for
learning and plagerization.
<http://home.ict.nl/~arivoors/>
be sure to get both the default version and 3D extensions. Examples
of some of my output at:
<http://802.11junk.com/jeffl/antennas/>

Another freebee is CocoaNEC for the Mac.
<http://homepage.mac.com/chen/w7ay/cocoaNEC/>

Yet another free program:
<http://mmhamsoft.amateur-radio.ca/mmana/>

The free demo version of EZNEC works nicely for simple antennas. There
are also demos for some rather expensive commercial packages, that are
suitable for tinkering and learning.

There are others at the bottom of:
<http://en.wikipedia.org/wiki/Numerical_Electromagnetics_Code>
and in:
<http://www.si-list.net/swindex.html> (old but worth reading)
More:
<http://www.dxzone.com/catalog/Software/Antenna_analysis/>

>UHF and VHF bands.
>- My big point of couriosity right now is reflectors.
>I want to see the effects of various wires, rods, screens,
>foil, etc.

You'll probably need to convert your surfaces to a wire grid (mesh).
4NEC2 includes a wire mesh generator called a "geometry builder". Some

examples:
<http://www.softpedia.com/progScreenshots/4nec2-Screenshot-110359.html>

>I suppose that I could pepper the group with questions.
>But, at some point it's best to do my own damn research.

Most basic questions can be answered with RTFM and Learn by
Destroying. Please make a few mistakes on your own before asking.

Let assume that something is radiated from the end when the charge
(compressed electrons) appears. There are the two ends. How many pulses will
be send in space ?
>
>>Does your measurements distinguish radiation from the spakrks from that
>>from
>>the plates?
>>S*
>
> Of course they do. More the question: can you measure them too?

No. The only instrument I have is the comb. But it was enough to verify the second meaning of word "polarisation". Everywhere is written that a charged comb attract a stream of water. And that it is caused by polarisation.
It is caused by electrostriction. Decreasing E-field deform water stream. Of course the electrostriction is caused by the polarisation of H2O particles.
Charged comb do not attract water drops.

> If you cannot, then this explains the nonsense.

Something is radiated from the ends of the dipole. Can you detect it?

Letter from June 1949 QST:

Dear Editor: I have followed with great interest your articles and correspondence on underground antennas.

I tried several directive beams buried in four feet of moist earth. After several reports from various hams I found I had no more power than with the old skywire. I dug deeper - even tried rhombics - but reports were still the same ('Nice sig, OM, but some guy in California has 10kw right on you.')!!! I consulted the old faithful ARRL Handbook and decided to try a multiple-wavelength vertical on ten meters.

I did not have to look far for a suitable antenna site. We have a 200-foot well right in our basement. I hooked a variometer to the final tank and from same connected a No. 6 stranded wire to a pipe running into the well.

I was delighted to raise a C2 in Hankow, China, on my first CQ. Chinese stations were heard that pinned the S-meter on the receiver.

I soon discovered that all I could work were Chinese amateurs. Now wouldn't this bear out the Handbook theory that 'the more wavelengths an antenna has, the more it tends to radiate straight off the end'? - W7LLE

Then you were told nonsense. At least study something with accurate
fundamentals.

>Let assume that something is radiated from the end

This alone explains why you have a very poor understanding of the
dynamics. An antenna radiates in ALL directions from EVERYPOINT of
the antenna. No one has to make special "assumptions" that are
limiting and with the appearance of being special knowledge.

>when the charge
>(compressed electrons) appears. There are the two ends. How many pulses will

The topics is polarisation. This word has the two meaning. The both have wrong explanations in texbooks. The one I have verified with the comb. The second "wave polarisation" is explained with transverse waves. No transverse waves. If receiver (resonator) must be parallel to emmiter you can explain it in many ways. But to verify it the comb is not enough. So I need help.

That is fair. Let's start with some serious misunderstandings with a
few questions to test them.

First, let us return to that link you offered with the Hertzian Loop
with its spark gap. Let us say that this loop is 1 meter of wire
(about the actual size anyway). Let us say there is a current
detector at each end of this loop. Let us say we have closed a switch
that applies voltage to the loop, and the first meter has indicated
current flow. This is our time reference point. Now the questions:

1. For the electron that went through the first current detector, how
long does it take for that SAME electron to get to the second
detector?

2. How long does it take for the second detector to indicate there is
current flow?

Hint: the answer for 1. is very, very different for the answer for 2.

Now, let us say that before that SAME electron gets to the second
current detector, that path is broken open (maybe 1 pico second before
the SAME electron arrival). The SAME electron sees an open circuit.
What is the amount of energy required for the electron to break out of
the metal conductor, and into the air?

You went to details. Early you wrote: "An antenna radiates in ALL directions
from EVERYPOINT of
the antenna. "
Textbooks say that EM transversial waves are emitted by current (the sparks
in Hertz apparatus - not from the ends).
I say that from the ends (as electric waves similar to acoustics).

The directional pattern must be different.
The directional patterns of loudspeakers and Herts dipoles are very
similar.
So I try to find evidences.
Now I do not know if you prefer EM or electric waves.

31e RADIO FLEA MARKET in BEETSTERZWAAG on 30 May 2009

The radio flea market takes place to - 30 May 2009. Do you look for an exotic transistor kit or a super recipient, fixed and do manufacture kit...
or do meet of radio friends? Dan comes Saturday 30 May to the Friese radio market into Beetsterzwaag!

Many thousand visitors come each year from the entire Netherlands and Europe to this radio flea market spectacle, approx. 100 dealers, with most diverse articles, like transmitters, recievers, power supplies, antennas, software, hardware and literature.

Additionally of businessmen in the place also a flea market with many attraction organized for large and small. There are some sales desks free at the moment on the radio flea market, you can reserve by telephone & email, contact on to take with the executive committee. Down are these addresses.

How does one find after Beetsterzwaag? From direction Apeldoorn = > Zwolle = > Meppel = > Heerenveen = > Drachten, departure after Gorredijk Tijnje comes departure (28) Beetsterzwaag.

From direction Bremen = > Groningen = > Drachten = > Heerenveen, departure after Drachten Haven comes departure (28) Beetsterzwaag.

On 2mtr, 145,700 Digi Heerenveen can one to instruct leave themselves. Inlet is from 09:00 to 16:00 MESZ, into which Cafeteria one also boarded into this time.

This whole is organized of VERON FRIESE WOUDEN. Cordially Welcome in Friesland on the 31e FRM!

Look for more information at the site: www.frm.a63.org

They do.

>Textbooks say that EM transversial waves are emitted by current (the sparks
>in Hertz apparatus - not from the ends).

That is not the same thing as radiation. Repeating poor quotations
does not make it better.

>I say that from the ends (as electric waves similar to acoustics).

Compressional waves or longitudinal waves? In solid or air or in
liquid? The answers to these questions lead to very, very different
behavior. As I say, these simplicities you use are nonsense.

>The directional pattern must be different.

The directional pattern is a combination of EVERYPOINT radiating in
ALL directions. The differences in their position contribute to an
unique pattern. This is the whole basis of the "method of moments"
application of modeling radiation emitters.

>The directional patterns of loudspeakers and Herts dipoles are very
>similar.

The are more differences than similarities.

>So I try to find evidences.
>Now I do not know if you prefer EM or electric waves.

That shouldn't keep you from answering the simple physics of:
Let's start with some serious misunderstandings with a
few questions to test them.

First, let us return to that link you offered with the Hertzian Loop
with its spark gap. Let us say that this loop is 1 meter of wire
(about the actual size anyway). Let us say there is a current
detector at each end of this loop. Let us say we have closed a switch
that applies voltage to the loop, and the first meter has indicated
current flow. This is our time reference point. Now the questions:

1. For the electron that went through the first current detector, how
long does it take for that SAME electron to get to the second

detector?

2. How long does it take for the second detector to indicate there is current flow?

Hint: the answer for 1. is very, very different for the answer for 2.

Now, let us say that before that SAME electron gets to the second current detector, that path is broken open (maybe 1 pico second before the SAME electron arrival). The SAME electron sees an open circuit. What is the amount of energy required for the electron to break out of the metal conductor, and into the air?

no distance required, and no antenna required, just put the signal through a
diode or other non-linear element and you will get some component at double
the frequency.

Blaming references is a very strong indicator of you having the
problem, not the textbooks.

>The one I have verified with the comb.

I've read that, and it proves nothing that is part of the topic (I
shall explain below).

>The second "wave polarisation" is explained with transverse waves. No
>transverse waves.

If "no," then what "yes?"

Actually you have mixed up two different characteristics. Polarity
and polarization are NOT the same thing. With RF radiation, the wave
is constantly changing polarity (that is why the source of RF is
called alternating current), but within the "line of sight" of the
antenna, the polarization for a dipole is defined by its angle to the
earth as viewed by the observer.

If you see an horizontal dipole, it produces alternating polarities of
waves with horizontal polarization. If you see a vertical dipole, it
produces alternating polarities of waves with vertical polarization.

RF energy is ALWAYS changing polarity.

> If receiver (resonator) must be parallel to emmiter you
>can explain it in many ways. But to verify it the comb is not enough. So I
>need help.

The comb was useless in proving anything about RF, antennas, or
polarization. What it demonstrates is induced polarity in a
dielectric. Interesting, but entirely unrelated to the topic.

In EM are many simplifications. Electric waves are like the acoustic. Of
course they kick the electrons in antennas not a membranes.
>
> Actually you have mixed up two different characteristics. Polarity
> and polarization are NOT the same thing. With RF radiation, the wave

In transvers waves something changes the direction of rotation. The source
makes rotating oscillations.

>(that is why the source of RF is called alternating current), but within

>
>You decribe the electric waves.

I am describing radiation.

>The Acoustic analogy will be also interesting.
>S*

No, it would not. Radiation is wholly unlike acoustics and very few people actually understand acoustics. Having the experience of "hearing" does not qualify you as being proficient in its discussion. Human sensation is vastly more illusion than science.

This is quite evident in your postings where you rely on crude simplifications and incorrect metaphors. The proof of their failure in your being to understand the topic of wave polarization is you cannot answer:

First, let us return to that link you offered with the Hertzian Loop with its spark gap. Let us say that this loop is 1 meter of wire (about the actual size anyway). Let us say there is a current detector at each end of this loop. Let us say we have closed a switch that applies voltage to the loop, and the first meter has indicated current flow. This is our time reference point. Now the questions:

1. For the electron that went through the first current detector, how long does it take for that SAME electron to get to the second detector?

2. How long does it take for the second detector to indicate there is current flow?

Hint: the answer for 1. is very, very different for the answer for 2.

Now, let us say that before that SAME electron gets to the second current detector, that path is broken open (maybe 1 pico second before the SAME electron arrival). The SAME electron sees an open circuit. What is the amount of energy required for the electron to break out of the metal conductor, and into the air?

These are very fundamental concepts that, if you cannot respond to them, reveal your range of involvement is extremely thin and you probably have no real interest in the topic.

Why are you posting here?

To lern something from engineering people. I was sure that people in this
group must know such phenomenon. It was Brian Howie. He wrote: "You can get

ionospheric mixing of radio waves. e.g Luxembourg Effect; so
doubling is possible."

Today I found this:
http://durenberger.com/resources/documents/LUXEMBOURGEFFECT0235.pdf
So I have known what I want to know.
Of course my explanation of the phenomenon is as I described here.
It is not easy to understand me. I am sure that Wim does. He wrote "If you
would like to know more about EM-fields related to antennas and electronics,
just start with classical EM theory. This is a solid
tool, existing over 100 years and is used by many people with succes
to predict behaviour of circuits and antennas. If this will change of
today, I will close my business activities next monday"

Most engineering people very quickly forget the "classical EM theory" as was
tought in schools. In the "classical EM theory" no electrons. Engineering
use his own physics with electrons.

The students are different, not the Physics. There is also college
physics and University physics. The sense here is that you are adept
at calculus (University) or you are not (college). Your explanations
of physics are not even High School (Gymnasium) level.

>> Why are you posting here?

What was the point of quoting this when you have done nothing from his
advice?

>Most engineering people very quickly forget the "classical EM theory" as was
>tought in schools. In the "classical EM theory" no electrons. Engineering
>use his own physics with electrons.
>S*

This worn out phrase is repeated so much that I don't think you are
really interested in anything more than trolling.

If you actually found a solution in the Luxembourg effect you could
answer:

First, let us return to that link you offered with the Hertzian Loop
with its spark gap. Let us say that this loop is 1 meter of wire
(about the actual size anyway). Let us say there is a current
detector at each end of this loop. Let us say we have closed a switch
that applies voltage to the loop, and the first meter has indicated
current flow. This is our time reference point. Now the questions:

1. For the electron that went through the first current detector, how
long does it take for that SAME electron to get to the second
detector?

2. How long does it take for the second detector to indicate there is
current flow?

Hint: the answer for 1. is very, very different for the answer for 2.

Now, let us say that before that SAME electron gets to the second
current detector, that path is broken open (maybe 1 pico second before
the SAME electron arrival). The SAME electron sees an open circuit.
What is the amount of energy required for the electron to break out of
the metal conductor, and into the air?

RF currents needing to travel a lengthy path through the earth to reach such a vertical buried wire would encounter high losses.

The function of buried radials is to provide a low loss return path for the r-f conduction currents induced in the earth near a monopole, which result from displacement currents generated by radiation from the monopole. Almost all of these currents lie within a radius of 1/2 of a free-space wavelength (regardless of the monopole height).

So the most efficient collection of these ground currents means the radials should extend about 1/2 of a free-space wavelength from the base of the monopole -- so that the currents won't have to travel very far through the lossy earth before they are "captured" by a radial wire.

The electrical length of buried radials with respect to the reduced v.p. in their environment has no real bearing on how effective the radials are at reducing the r-f loss in the ground system.

The r-f loss present in the radial ground system doesn't affect the shape of the relative field pattern generated by the monopole, or the propagation of the fields launched by the monopole. But as that ground system loss is in series with antenna current, it will affect the radiation efficiency of the antenna system.

A benchmark, real-world study of this subject was made by Brown, Lewis & Epstein of RCA Labs in 1937. It showed showed that 113 evenly-spaced, buried radials each 0.412 free-space wavelengths long and used with monopoles from ~70 to 90 degrees in height produced measured surface-wave fields at 3/10 of a mile that were within 2% of those generated by a perfect monopole with a zero-loss r-f ground, over a zero-loss ground plane.

This corresponds to an antenna system efficiency of about 96%, or 960 watts radiated for 1,000 watts applied to the feedpoint. For a monopole with a radiation resistance of 36 ohms this 96% efficiency means that the r-f resistance in the ground system is about 1.5 ohms. There wouldn't be much practical benefit gained by using more/longer radials.

The BL&E tests were conducted in the sandy soil of New Jersey, where earth conductivity is rather poor.

Years ago I could get some shortwave reception by placing the
radio's whip antenna across the window and lowering the shade
to keep in place (and hide the radio). MW stations were generally
too weak to listen to. FM was a jumble at altitude.

These days RFI from the cabin entertainment systems completely
blanks out everything so don't bother trying. Be thankful MP3 players
still work.

On all levels is: "James Clerk Maxwell's mathematical theory of 1873 had
predicted that electromagnetic disturbances should propagate through space
at the speed of light and should exhibit the wave-like characteristics of
light propagation."

Next on all levels is that the light waves are transversal because they can
be polarised.

Maxwell described it in his Treatise in words and in equations (are on-line)

With a window seat, FM works OK, especially (as has been said) with the
whip held close to the window. You can also get some SW reception. [I
remember listening to the BBC World service at 35,000 feet.] MW AM is
pretty useless (at those frequencies, the airframe is a Faraday cage).

Some airlines are/were OK about using radio receivers during the flight,
but I understand that these days, regardless of what the airline says,
you might get challenged by some 'over enthusiastic' security guy during
the normal departure security checks.

About 10 years ago (before the recent troubles), I did do some listening
on a UK-USA transatlantic flight. On approaching North America, I was
initially surprised that the first FM station I heard was
French-speaking (from Quebec, of course). I was relieved when I realised
that the 'driver' had not got lost.

S" needs to go back and read in totality the paper on Luxenbourg
Effect. It explains that you DO in fact have a non-linear medium in
the form of a charged ionosphere during periods of the effect.
It is also difficult to tell whether or not what seems to be a case of
the Luxenbourg effect is in fact just intermodulation distortion
occurng in the receiver.

Let's just skip the extremely difficult matters for you. It was your
reference source but you don't seem to have read it yet (apparently
the Luxembourg paper suffers your attention as well). If this were an
audio based group instead of a text based one, maybe you could find a
lectrice.

One notes that you need to have permission from the plane's pilot to operate any sort of radio (including a receiver) while in flight. With receivers, the concern is with things like Local Oscillator or other leakage signals.

Whether this is a legitimate concern is a topic of discussion (e.g. they've flown commercial planes with an antenna and logging spectrum analyzer in an overhead bin, and discovered that lots of folks forget to turn off their cell phones), but the fact remains that the regulations

say no radios, except those permitted by the pilot in command.

The paper is from 1935. The year and half after the first observation. Now
we have 2009.
Probably were the next observations. Some of you may have yours own.
What we need to analyse:
1. Type of mast (half-wave, or 1/4) and the frequency,
2. The frequency at which on the receiver a faint background appears.

Of course only the cases where the frequency doubling take place.
S*

Distance is not mentioned as a factor.

I have found the next:
http://books.google.pl/books?id=QSkeg9wmMDAC&pg=RA1-PA53&lpg=RA1-PA53&dq=radio+luxembourg+effect&source=bl&ots=nvhehrL1CA&sig=IyiVbyHeTJx56YEI5pe1lAFdl9I&hl=pl&ei=Ak0MSs-uEYzN-QbMr8meBg&sa=X&oi=book_result&ct=result&resnum=3#PRA1-PA53,M1

There on the page 53 you can find that the medium-wave were disturbed by the
long-vave (halve-way between).

And the reality is the pilot in command of commercial aircraft has to
follow the policies of his employer, most of which take the safe
route of banning everything that might even remotely cause a problem.

Well, about 10 years ago, Virgin Atlantic certainly did list radio
receivers as OK to use in flight (and I took advantage of the facility).
I'm sure that they would have been fully aware of possible technical
problems. However, the novelty soon wears off, and haven't bothered even
checking (or listening) since. In any case, the size and weight of your
carry-on bag has been severely curtailed (and such restrictions
enforced) and, on a 9 or 10 hour flight, you find that need to be more
circumspect about what you choose to pack in your cabin bag.

Gordon,

The ARRL Antenna Book at $40.00 is an excellent reference and worth the money all by itself. However, the book includes a CD with EZ-NEC models of the antennas, and a modified version of EZ-NEC software that allows you to open/manipulate those models (no limit on # of elements like the "demo" version - but you cannot save your modified files).

IMHO, this is an excellent way to begin using modeling software, using existing models, with little or no financial risk (like I said, the book alone is worth $40). If you decide you like the program, buy it! You can still access all of the ARRL's models as you experiment and extend its antennas with models of your own.

I am no expert with this stuff, but I have been using modeling software for many years. I never begin modeling an antenna from scratch; instead I start with an existing, similar antenna (one from the ARRL book or from the Cebic collection) and modify it.

1. Does achieving a conjugate match via a transmatch between the transmitter and line do anything to reduce or eliminate mismatch loss in the line? In other words, if a line is 8:1 swr into a complex impedance load are the 8:1 "mismatch" losses still occurring even after achieving low swr with a transmatch?

2. (Unrelated to first question) After installation of a choke at the antenna input, swr on my off center fed dipole is surprisingly flat across the amateur bands, never rising much above 8:1 and this only on the high end of 80 meters. Reading Maxwell's "Reflections" series, it seems that this may be due to saturation of the choke at higher frequencies and I may have introduced non negligible loss into my antenna system. The choke was made by winding my RG-58 coax through a 3" toroid of unknown permeability (14 turns). Other than the toroid being solid black, I can't tell you anymore about it. I am using an MFJ-259B for measurements. It would seem to me the 259B would not be capable of delivering enough power to saturate the large toroid so maybe my "too flat" readings are occurring due to something else.

Any advice on the above much appreciated. Please include a comment on the ability of the 259B to be affected by toroid saturation.

Not all MegaWatt LW stations are the Hertz dipole. Such was in Warsow but
collapsed.
If station has only one end no doubling. Even if it has two the lower must
have the same possibilities (tip top of mountain).

But the main issue is not doubling. Are you sure that magnetic whirl exist
around a wire?

i wouldn't call 8:1 'flat', i aim for 2:1 across the 6 hf contest bands,
excluding the high end of 80m. an important consideration is the length of
that rg-58 and what kind of condition it is in. with only 1db of loss in
the cable you could get 8:1 with almost an open or short circuit at the
antenna end... that would be about 50' at 28MHz.

>
> Any advice on the above much appreciated. Please include a comment on
> the ability of the 259B to be affected by toroid saturation.

no, the 259b won't saturate your toroid, but a very lossy toroid could be
contributing to the 'flatness'.

> after achieving low swr with a transmatch?

In an ideal system, achieving a conjugate match at the
transmatch ensures a conjugate match between the tuner
and the antenna. In a low-loss system, that conjugate
match is close but not perfect. A conjugate match and
an impedance match are NOT the same thing if the SWR
is not 1:1 on the transmission line.

A conjugate match ensures that maximum power is delivered
to the load which ensures maximum current in the transmission
line which ensures maximum losses in the transmission line
due to SWR.

A conjugate match does not change the impedance mismatch
or SWR between the transmatch and the antenna. What is
usually achieved by a transmatch is a Z0-match at a point.
A Z0-match usually ensures that reflected energy will not
reach the source and is instead, redistributed back toward
the antenna.

Think of the conjugate match from the transmatch as making the line to look
as if a 1/2 wave line and transforming to it. There will still be resistive
losses in the tuner and line accentuated by higher than normal voltages and
currents.

This is a ridiculous observation. However, if I were to allow it, it
thus also means that SOME MegaWatt LW stations are "the Hertz dipole,"
by your own admission (which is significantly in question as to be
authoritative because you don't really know, do you?).

>If station has only one end no doubling. Even if it has two the lower must
>have the same possibilities (tip top of mountain).

As SOME MegaWatt LW stations are "the Hertz dipole," it follows there
must be literally billions of examples of what you describe. And yet
you offer no personal experience, and the record is empty of others'
observations.

MythBusted = Trash and False.

You can use your 259 to measure the permeability of your toroid, and
infer what mix it is.

Measure the inductance of an inductor with a few turns on the toroid.

From that, you can get the inductance factor.. a few minutes searching
the catalog will probably find a match, given the physical size.

Thanks Dave, Cecil and JB for taking the time to reply. Sounds like even with a conjugate match at the transmitter, I need to calculate total line losses based on SWR readings without the transmatch in the line. Also thanks for the advice on the choke and 259B. I could have a lossy toroid making things look better than they actually are. I believe I'll try making an air core choke by simply coiling turns in the coax at the antenna connection and see how that changes things. Actually even with the toroid choke the antenna is working pretty well for the wire antenna and low power setup I have here. Fun trying different things though and I like to fiddle around.

I have for sale a very nice Yaesu G-400RC Rotator and Controller. These rotors are similar to the Yaesu G-450s but they do not require a special plug on the rotor or the controller for the cable like the G-450s do. In very good shape cosmetically and it works well. Price is $175, shipped in CONUS. Pictures available.Thanks, Charlie Hugg, K5MBX

The others' obserwations were made in 1933 and a few next. Engineers are so
clever people that they very quickly found a remedy.

Is the two: doubling and polarisation.
1. ""Over long distances, the atmosphere can cause the
polarization of a radio wave to fluctuate, so the distinction between
horizontal and vertical becomes less significant." From:

http://whatis.techtarget.com/definition/0,,sid9_gci843762,00.html

2. It seems that at long distances should appear the phenomenon of frequency doubling.

The common is "wave propagation"or more precise "are Radio Waves transverse or longitudinal"?
What is your opinion?

I have for sale several E.F. Johnson Matchboxes/Antenna Tuners: 1. (SOLD)Model 250-23-3. This is the small 275 watts AM tuner(good for over a KW PEP SSB). It has the built in SWR Meter and outboard Coupler. Nice shape. Price is:$135; 2. Model 250-23. Small tuner as above but without the Meter and Coupler. Good shape. Price is:$75; 3. Model 250-30. This is the Large KW AM tuner(good for much more on SSB). This model does not have the Meter or Coupler. It is in very nice shape. Price is: $250; 4.(SOLD)Model 250-30-3. Large KW AM model as above, but it has the Meter. Requires Coupler not supplied. This one works but is rough cosmetically. Digital pictures available. Price is $135. I will split shipping within CONUS for all tuners. Thanks, Charlie Hugg, K5MBX

If your feedline between the transmatch and the antenna is
50 ohm coax, you can leave the transmatch in the system and
use a separate SWR meter on the output of the transmatch to
measure the SWR on the coax between the transmatch and the
antenna.

If you don't have 50 ohm coax between the transmatch and
the antenna, you are SOL in determining the actual SWR on
the ladder-line or whatever with a standard SWR meter. The
50 ohm SWR reading without the transmatch is completely
different from the actual SWR on the transmission line when
the Z0 is not 50 ohms.

Even the SWR reading looking into ladder-line using an
MFJ-259B is nowhere near the actual SWR on the ladder-
line. For instance, a 50 ohm SWR meter can read a 1:1
SWR on 450 ladder-line when the actual SWR on the ladder-
line is 9:1.

Thanks Cecil, I see what you mean. The 450 ohm line could be seeing an impedance of 50 ohms making the swr 9:1. The MFJ-259B, being 50 ohm based, and seeing the 50 ohms would call the swr 1:1. Kind of obvious but something I probably would have overlooked. I'll get out the manual for the 259b and see if MFJ cautions the user on this.

Well, that is an approximation based on a number of assumptions. If you don't know the assumptions, or cannot be sure that they apply, it is better to calculate the line loss based on the load impedance (or inference from the input impedance).

See TLLC at http://www.vk1od.net/calc/tl/tllc.php , or TWLLC at http://www.vk1od.net/calc/tl/tllc.php .

My article "Additional loss due to VSWR" at http://vk1od.net/blog/?p=316 canvasses the issue.

the big bang.
You attribute everything to the photon but I don't think physics as
got a proper handle on it! Heck, only a few years ago they said a
particle could exist without mass.If a particle emitted from the Sun's
boundary(lepton?) deaccellerated in a particular medium
and broke apart into many electrons, then would not heat or light be
emitted as kinetic energy contained in the particles of different
sizes representing the spectrum
of a particular color with respect to potential energy contained in
the various sized particles? Does your photon come in different sizes,
color and potential energy?
My understanding is that there are about seven leptons that break away
from the Sun's boundary, three of which contains color attributes
along with other flavours which is indicative of temperature and
change in momentum.
>I think it is to early to argue about such a subject.

May be it is time to return to the beginning. To the Hertz experiment. See:
(http://people.seas.harvard.edu/~jones/cscie129/nu_lectures/lecture6/hertz/Hertz_exp.html

What and from radiated?
1. Maxwell's waves from the big sparks (the big sparks are in full analogy
to lightning which also radiate radio waves),
2. Electric waves from the two plates (there appear and disappear a huge
charges - electrons are compressible and have mass),
3. Photons

but amateur bands were initially assigned so that harmonics ended up in the
next higher band... but because transmitters generated harmonics because of
their design, not because the antennas or ionosphere created them.

>

Szczepan Białˇek wrote:
> Heck, only a few years ago they said a
> particle could exist without mass.

Photons have zero *rest* mass. If they had mass at
rest, they could not travel at the speed of light.
The mass of a photon is due to its velocity, c in
free space. When a photon slows to less than the speed
of light in a medium, it gives up its energy to another
particle, e.g. an electron, and disappears.

> 3. Photons

EM radiation from amateur radio antennas is photonic.
RF energy is supplied to the antenna system by our
transmitters. Free electrons are accelerated and
decelerated. Photons are emitted and absorbed by
those free electrons. Some of the photons escape
into space as coherent radiation.

One can learn a lot about EM waves by understanding
the nature of photons. For instance, standing waves
consist of photons that cannot stand still. The
illusion of a "standing" wave is just two waves of
photons moving in opposite directions at the speed
of light. Photons are not like mashed potatoes.

3105. Low angle radiation skip

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-16 16:57:55 UTC
From: Art Unwin <ArthurUnwin@gmail.com>
Message-ID: <808150d9-a35e-414c-b637-ae1500890a62@g20g2000vba.googlegroups.com>
Source record: 15579

In the good old days of multi sunspots it was not unusual for 10 M
skip
ducting all around the World to the point of emmission about one
second later. Ofcourse 10M provides a low TOA. Which brings up a
question, what is the lowest angle known for a particular skip
distance or where can one find reference to such? Low angle take off
have to deal with the grazing action as well as the point of change
over from reflection and ducting as well as absorbtion and the ground
hugging phenomina. But at the back of my mind I seem to remember an
instance where a dish was able to obtain low angle television(big,
big dish) which I seem to remember was not temperature related.
Anybody got any comments that they have read in the past with respect
to low angle take off, limits e.t.c.?
Regards
Art

>frequences?

They're likely to be three bands of frequencies rather than three
narrow single-frequency lines, because the technologies used to create
the frequencies aren't narrow-band. But, yes, what you are seeing as
"perfectly white" under these circumstances is often *not* a smooth,
continuous spectrum.

In the case of a TV screen, you're seeing either:

- The mixed emissions of a set of red, green, and blue phosphors,
individually excited by electron beams [for CRT displays], or

- The emission from the phosphors of a cold-cathode fluorescent
backlighting lamp (a complex spectrum with multiple peaks) filtered
through red, green, and blue pixel-sized filters (for most LCD
tubes).

In traditional film cinema, you're seeing the emissions of an
incandescent or halogen bulb (fairly continuous spectrum) filtered
through three colors of dye in the film print.

The fact that these complex mixtures of overlapping color spectra can
look "pure white" to our eyes, is due in large part to our complex
nervous systems. Our eye/brain systems adapt to the mix of colors
present under differnet lighting conditions, and interpret different
combinations as "pure white" depending on what's available at the time.

This is why, for example, indoor fluorescent lighting can actually
look half-decent to our eyes once we get used to it (we "see" a fairly
complete range of colors there) but what looks "white" to use under
fluorescents will actually have a distinctly greenish cast to a film
or digital camera.

It's also why a rather curious phenomenon can be demonstrated. The
exact same mix of color emissions may look very different to us,
under different ambient lighting conditions... what might look
greenish outdoors will look pure white or even slightly pinkish under
indoor fluorescent lighting, because our brains *interpret* that input
differently due to the different surroundings.

> but amateur bands were initially assigned so that harmonics ended up in
> the next higher band... but because transmitters generated harmonics
> because of their design, not because the antennas or ionosphere created
> them.

Discussion with Wim: ">In case of non-linear parts in a system (for example
a corroded
connector in an antenna cable that is used by two or more
transmitters, that may behave as a semiconductor), you might get so
called mixer products (sum frequencies, harmonics, difference
frequencies, etc)."

My answer was: "Harmonics may be the reason that nobody have seen the
Phenomenon."

It is not mine. It is by Ampere, Gauss, Weber, Helmholtz and many other
prominent scientists.
Helmholtz wrote the same equations for whirls in fluids. Maxwell admited it
in his Treatise "On line of forces".
So EM is the hydraulic analogy. Now for electrons the Gas analogy is better.
I am only a kibitzer.

The most valuable was your statement: " An antenna radiates in ALL
directions from EVERYPOINT of
the antenna."
It meens for me that they are longitudinal. In ALL directions like
acoustics. From EVERYPOINT (of the end). In today's antennas before the end
are cabels in which the current oscyllates. EM waves radiate from this part
of the circuit where the current oscillate (in end no current). In the end
the electrons gathers periodically and radiate alternate electric field in
ALL directions.
Has it sense?

No, it hasn't sense. You need to post on the physics newsgroup where
your ideas will be appreciated by all the self-anointed geniuses who
think they understand electro-magnetics. Nothing anyone writes here is
going to convince you you're wrong. People with pet theories never give
them up. This newsgroup has become a repository for flawed physical
theories. Maybe, someday, it will get back to being a forum for hams who
just want to discuss antennas.

WHAT IS ISLAM?

Can we find an explanation of the great universe? Is there any convincing interpretation of the secret of existence? We realize that no family can function properly without a responsible head, that no city can prosperously exist without sound administration, and that no state can survive without a leader of some kind. We also realize that nothing comes into being on its own. Moreover, we observe that the universe exists and functions in the most orderly manner, and that it has survived for hundreds of thousand of years. Can we then say that all this is accidental and haphazard? Can we attribute the existence of man and the whole world to mere chance.

Man represents only a very small portion of the great universe. And if he can make plans and appreciate the merits of planning, then his own existence and the survival of the universe must also be a planned policy. This means that there is an extraordinary power to bring things into being and keep them moving in order.

In the world then must be a great force in action to keep everything in order. In the beautiful nature there must be a Great creator who creates the most charming pieces of art produces every thing for a special purpose in life. The deeply enlightened people recognize this creator and call him Allah "God". He is not a man because no man can create or make another man. He is not an animal, nor he is a plant. He is neither an Idol nor is He a statue of any kind because non of these things can make itself or create anything else. He is different from all these things because he is the maker and keeper of them all. The maker of anything must be different from and greater than things which he makes.

There are various ways to know God "ALLAH'' and there are many things to tell about him. The great wonders and impressive marvels of the world are like open books in which we can read about God. Besides, God Himself comes to our aid through the many Messengers and revelations He has sent down to man. These Messengers and revelations tell us everything we need to know about God.

The complete acceptance of the teachings and guidance of God 'Allah' as revealed to His Messengers Muhammad is the religion of Islam. Islam enjoins faith in the oneness and sovereignty of Allah, which makes man aware of meaningfulness of the Universe and of his place in it. This belief frees him from all fears and superstitions by making him conscious of the presence of the Almighty Allah and of man's obligations towards Him. This faith must be expressed and tested in actions, faith alone is not enough. Belief in one God requires that we

look upon all humanity as one family under the universal Omnipotence of God the Creator and Nourisher of all. Islam rejects the idea of chosen people, making belief in God and good actions the only way to heaven. Thus, a direct relationship in established with God, without any intercessor.

Islam is not a new religion. It is, in essence, the same message and guidance which Allah revealed to all Prophets. Adam, Noah, Abraham, Ismael, David, Moses and Jesus (PBUT). But the message which was revealed to Prophet Mohammed (PBUT) is Islam in its comprehensive, complete and final form.

The Quran is the last revealed word of Allah and the basic source of Islamic teachings and laws. The Quran deals with the basis of creeds, morality, history of humanity, worship, knowledge, wisdom, God-man relationship, and human relationship in all aspects. Comprehensive teaching on which, can be built sound systems of social justice, economics, politics, legislation, jurisprudence, law and international relations, are important contents of the Quran. Hadith, the teachings, sayings and actions of Prophet Mohammed (PBUT), meticulously reported and collected by his devoted companions. Explained and elaborated the Quranic verses.

THE FUNDAMENTAL ARTICLES OF FAITH IN ISLAM

The true faithful Muslim believes in the following Principal articles of faith:-

He believes in One God 'Allah', Supreme and Eternal, Infinite and Mighty, Merciful and Compassionate, Creator and Provider.
He believes in all Messengers of God without any discrimination among them. Every known nation had a warner or Messenger from God. They were chosen by God to teach mankind and deliver His divine message. The Quran mentions the name of twenty five of them. Among them Mohammad stands as the last Messenger and the crowning glory of the foundation of Prophethood.
Muslin believes in all scriptures and revelations of God. They were the guiding light which the Messengers received to show their respected peoples the Right Path of God. In the Quran a special reference is made to the books of Abraham, Moses, David and Jesus. But long before the revelations has been lost or corrupted. The only authentic and complete book of God in existence in the Quran.
The true Muslim believes in the Angels of Allah. They are purely spiritual and splendid beings whose nature requires on food, drink or sleep. They spend their days and nights in the worship of God.
Muslim believes in the last Day of Judgement. This world will come to an end someday, and the dead will rise to stand for their final and fair trial. People with good records will be generously, rewarded and warmly welcomed to the Heaven of Allah, and those with bad records will be punished and cast into Hell.
Muslim believes in the timeless knowledge of God and His power to plan and execute His planes and nothing could happen in His Kingdom against

His will. His knowledge and power are in action at all times and command over His creation. He is wise and merciful, and whatever He does must have a meaningful purpose. If this is established in our mind and hearts, we should accept with good faith all that He does, although we may fail to under stand it fully, or think it is bad.
THE FIVE PILLARS OF ISLAM

Faith without actions arid practice is a dead end, as far as Islam is concerned. Faith by nature is very sensitive and can be most effective. When it is not out of practice or out of use, it quickly loses its liveliness and motivation power.

There are five pillars of Islam:

The declaration of faith: To bear witness that there is none worthy of worship except Allah, and that Mohammad (PBUH) is His Messenger to all human beings till the Day of Judgment. The Prophethood of Mohammad obliges the Muslims to follow, His exemplary life as a model.
Prayers: Daily, prayers are offered five times a day as a duty towards Allah. They strengthen and enliven the belief in Allah and inspire man to a higher morality. They purify the heart and prevent temptation towards wrong - doings and evil.
Fasting the month of Ramadan. The Muslims during the month of Ramadan not only abstain from food, drink and sexual intercourse from dawn to sunset but also sincerity and devotion. It develops a sound social conscience, patience, unselfishness and will - Power.
Zakkah: The literal and simple meaning of Zakkah is purity. The technical meaning of this word designates the annual amount in kind or coin which a Muslim with means must distribute among the rightful beneficiaries. But the religious and spiritual significance of Zakkah is much deeper and more lively. So it has humanitarian and sociopolitical values.
Hajj (Pilgrimage to Makkah): It is to be performed once in a lifetime, if one can afford it financially and physically.

Szczepan Bialek,

I think I speak for the collective readership when I say we are tired of your erroneous arguments about frequency doubling and its causes.

You evidently have read a little about the Luxembourg effect, but you failed to read the hundreds of articles available on the Internet on this subject. I suspect your problem is one of language and adolescent stubbornness combined.

To make things simple for you, do your search on "Ionospheric Cross Modulation". This is defined by the IEC (Commission Electrotechnique Internationale) in their IEC 60050 International Electrotechnical Vocabulary as:

Ionospheric Cross Modulation, Luxembourg effect ?
the modulation of a radio wave by the modulating signal of another wave having a different frequency, resulting from NON-LINEAR PHENOMENA in a region of the ionosphere through which both waves pass.

Or if French is easier for you to read:

Transmodulation Ionosph?rique, effet Luxembourg ? modulation d'une onde radio?lectrique par le signal modulant d'une autre onde de fr?quence diff?rente, qui r?sulte D'EFFETS NON-LIN?AIRES dans une r?gion de l'ionosph?re travers?e par les deux ondes.

Note the emphasized words. Non-linearity of the D-layer of the ionosphere is quite well understood today. In fact, most of the initial mechanism was known before the Second World War. In the late 1940's and in the 1950's, theories were improved as different modes of propagation were studied. Today we find that this ionospheric cross modulation effect has become a tool to study the lower ionosphere.

For some good reading on this subject, I suggest reading "An Introduction to the Ionosphere and Magnetosphere" by John Ashworth Ratcliffe. Much of this book can be read using Google Book Search. Another work found on the Web is the PhD dissertation of Mehmet K?rsad Demirkol from Stanford University (http://www-star.stanford.edu/~vlf/publications/theses/DermikolThesis.pdf). Quoting from his abstract:

Electron density and temperature changes in the D-region are sensitively manifested as changes in the amplitude and phase of subionospheric Very Low Frequency (VLF) signals propagating beneath the perturbed region. Both localized and large scale disturbances (either in electron density or temperature) in the D-region cause significant scattering of VLF waves propagating in the earth-ionosphere waveguide, leading to measurable changes in the amplitude and phase of the VLF waves. Large scale auroral disturbances, associated with intensification of the auroral electrojet, as well as ionospheric disturbances produced during relativistic electron enhancements, cause characteristic changes over relatively long time scales that allow the assessment of the 'ambient' ionosphere. Localized ionospheric disturbances are also produced by powerful HF transmitting facilities such as the High Power Auroral Stimulation (HIPAS) facility, the High frequency Active Auroral Research Program (HAARP*), and also by lightning discharges. Amplitude and phase changes of VLF waveguide signals scattered from such artificially heated ionospheric patches are known to be detectable.

Nowhere in all of the respected literature will you find frequency doubling caused by the two ends of a dipole. In fact, the end "balls" of Hertz's experiments were nothing more than capacitance hats. The experiment would have worked perfectly well without them.

You have pushed the patience to the breaking point of many of this newsgroup's readers, including some experts far more knowledgeable in electromagnetics than myself. Expletives from these people, while certainly deserved, are not needed. Until Szczepan does his research on ionospheric cross modulation, I suggest that we just ignore him (or use a killfile).

Good resources that will add to our composite knowledge. I will
browse them. As for HAARP, that "controversy" has faded considerable
from its first incendiary introduction years ago. I wonder if Stephan
will pick up on its implications.

This has what to do with amateur radio or antennas?

I covered the topic about 2 years ago in:
<http://groups.google.com/group/alt.internet.wireless/msg/fd25bae4b3f10c13>
The US incidence rate for brain and central nervous system cancers has
been fairly flat at about 6-7 cases per 100,000 population per year
since about 1975 (SEER 9). It's kinda difficult to pry a usable graph
out of the web pile, so I ran the "fast stats" for long term brain
cancer, for all age and ethnic groups. See:
<http://802.11junk.com/jeffl/crud/brain-CNS-cancer.jpg>
(Note that the incidence of brain cancer is actually decreasing with
time). If there were a correlation between cell phone use and cancer,
one would expect to see at least a nominal rise in brain cancer
incidence, as cell phone use has dramatically increased the same time
period.

The current FCC position on RF safety is at:
<http://www.fcc.gov/oet/rfsafety/>
<http://www.fcc.gov/Bureaus/Engineering_Technology/Documents/bulletins/oet60/oet60a.pdf>

Your risk of dying from a vehicle accident, while driving and talking
on a cell phone, is far greater than the alleged risk of contracting
cancer.

> This has what to do with amateur radio or antennas?

Amateur radio uses radio waves, and I believe that antennas propagate
them and receive them don't they?

But in any case, I thank you for your answer.

>cancer?

You could almost pump the odds to 100% by standing in front of an open
microwave ever day. Now, if I were to move that 1 in the 100 to the
right by 5 places (0.001%) would you feel better, or worse? What if
it were less than your chances for being hit by a car by simply
stepping out of your house? Not exactly cancer there, I will admit,
and perhaps a more compelling outcome (you might live another 20 years
with cancer, but only 15 minutes more impaled as a hood ornament).

>Or what about the radio waves that are being emitted from our
>personal electronic appliances?

We have entered the realm of getting out of bed to suffer being struck
by a comet.

>I have heard that there is some

Can you name 5 people (not related to each other) who do not live near
a power line? With luck, they will die of Heart disease first. For
most of us, that line is no further than 8 feet away.

>What is the state of research into this subject?

Settled. Of course, there are those who thrill to the thought of a
slow death like Camille's. Those romantics generally seek out
confirmatory evidence. Research, for their benefit, marches on.

I was thinking that some transparent and semitransparent substances are
phosphorescent (some time in dark) but ALL are less or more fluorescent
(rework frequency). Rube in laser rewoork into one. But in laser are many
passes. But what happens in one pass?
May be that it rework also but only a little.

Raman discovered that some substances can rework one frequency into many
(also in higher).
May be that a cotton screan also rework.

Yes. But for me is interesting the phenomenon at reflecting, scatering and refraction. May be that "polarisation" is an effect of that.

Is the light polarisation the hard prove that light vaves are transversal?

Chased out. No. Physics newsgroup is nice but there are all branches. Too
many posts, to many posters. Now I am in the subgroups: new theory and EM.
I am interesting in unifying gravity, electricity and magnetism. The
unifying is done by Aepinus and Ampere. I agree with them. But I understand
that as seperate are better to teach.
I also agree with Helmholtz that light waves are longitudinal.
With him do you agree?

So I do not have to read the above.

>In fact, the end
> "balls" of Hertz's experiments were nothing more than capacitance

It is impossible to make the dipole without ends.
>
> You have pushed the patience to the breaking point of many of this

> ignore him (or use a killfile).

I encourage ALL you to make proper experiments with the "frequency doubling
caused by the two ends of a dipole."
See discussion with Wim:

">Hello Szczepan,

>You are right, charge is compressible. The charge that is required to
charge (for example) a sphere seems

Seems or unquestionable?

> to break the coninuity equition as
is used for incompressible fluid in hydraulics.

>Continuity in electromagnetism is regained by introducing the D-field
(dielectric displacement). The D-field is responsible for the
capacitive current in case of varying E-field.

So in your products is the dielectric displacement or compressed electrons?

>Regarding frequency doubling. We can be lucky. Antennas and
propagation behaves in virtually all cases linearly. From linear
systems you might know that input and output frequency are the same,
so no doubling in frequency.

Try understand me. Your Hertz dipole emits electrc waves from the TWO ends
(opposite phases). So the electrons in a receiving antenna are kicked twice
more frequent.

>In case of non-linear parts in a system (for example a corroded
connector in an antenna cable that is used by two or more
transmitters, that may behave as a semiconductor), you might get so
called mixer products (sum frequencies, harmonics, difference
frequencies, etc).

Harmonics may be the reason that nobody have seen the Phenomenon.

>If you would like to know more about EM-fields related to antennas and
electronics, just start with classical EM theory. This is a solid
tool, existing over 100 years and is used by many people with succes
to predict behaviour of circuits and antennas. If this will change of
today, I will close my business activities next monday.

EM existing over 100 years and will be used the next as the "piece to
teach".
Your business base on experiments.
Now You have the opportunity to make the most famous experiment in the
history.
If the result will be null I will change my hobby."

Next your statement: "Actually you have mixed up two different
characteristics. Polarity
and polarization are NOT the same thing. With RF radiation, the wave
is constantly changing polarity (that is why the source of RF is
called alternating current), but within the "line of sight" of the
antenna, the polarization for a dipole is defined by its angle to the
earth as viewed by the observer.

If you see an horizontal dipole, it produces alternating polarities of
waves with horizontal polarization. If you see a vertical dipole, it
produces alternating polarities of waves with vertical polarization.

RF energy is ALWAYS changing polarity."

May be I do not understund but it seems that polarization means orientation
of the dipole.
But are the waves transversal?

It is not the case. I am asking about some details and some of you simply
give them me.

> People with pet theories never give them up.

Transversal vs. longitudinal is not theory. Next experiments are necessary.

if you ask then you would be expecting an answer and learn from that answer.
you have ignored the responses you have received and kept going back to your
own theories based on analogies that don't fit. if you really want to learn
then read and accept the answers you have received.

3136. Re: What is the correlation between radio waves and cancer?

So far, there is no correlation between non-ionizing radiation and cancer,
which includes cellphones in the 800 - 900 MHz band.

>But in any case, I thank you for your answer.

Ok. That's closer than most of the off topic rubbish the pollutes
most newsgroups. I can see you logic. After reading some of the
postings in this newsgroup, I too might suspect that exposure to RF
and antennas might produce insanity, illogic, political conservatism,
and delusions of omniscience.

Incidentally, someone wrote me noting the peak on the graph around
1985 and offering various theories as to the origin of the peak. I
should point out that the total variation over 30 years (from 0.6 ppm
to 0.7 ppm) yields a total variation of 0.001%. That's well within
statistical error limits, and is essentially flat. The most likely
reason for the slight increase in incidence is that PET scanners
became available for diagnosis in the early 1980's, which probably
produced a small increase in additional early diagnosis cases. This
peak tapered off as PET scans became routine.

There's also the issue of delayed reactions to RF exposure. This is
certainly a real possibility as some cancers appear perhaps 20 years
after exposure. However, with such a huge increase in cell phone use
between 1975 and 2006, there's not even the slightest indication in
the cancer incidence curves of a corresponding, but delayed, increase.
If anything, there's a slight decrease in brain cancer incidence,
which suggests that using a cell phone may help PREVENT brain cancer.

Go to http://www.fcc.gov/Forms/Form605/605.html, and read the overall
instructions.

If you want to do it by paper, click the link on that page to download
a copy of Form 605, and print it. On the form, select an application
purpose of MD (modification of license) in field 2, fill in your
callsign in field 5, fill in the rest of the applicable fields, sign
it, and mail it in.

Or, you can click the "Online Filing" link... this will bring you to a
page with an overview of the ULS (Universal Licensing System).

To use the online system, you need to be registered with the ULS,
which requires your FRN (registration number, associated with your
callsign) and a password.

http://wireless.fcc.gov/uls/index.htm?job=about_getting_started has
the details.

The question was: "It seems that at long distances should appear the
phenomenon of frequency
doubling.
Is such?"
S*

Till today was only one Yes (Brian Howie). The rest were No.
Today Dr. Barry L. Ornitz wrote: "Nowhere in all of the respected
literature will you find frequency
doubling caused by the two ends of a dipole."

So now I know what I want. Do you agree with Dr.?

Now I read only the description (original if possible) of experiments and
observations. Interpretations and explanation I do myself.
Now are many publications because they are obligatory (like homework). The
problem transverse vs longitudinal is now very simple. In nature no pure
transverse waves. Always are the two components. Even water waves are
largely longitudinal.
But we need the explanation for light polarization. So I am here.

In that they are both waves-- yes.

Acoustic waves are longitudinal. Electric (and magnetic) waves are (almost
always) transverse.

You may want to ask your question again as a separate topic. Maybe you will
be fortunate to launch a thread as long as that from the simple (earlier)
question about how an EM wave propagates.

THAT one went on fo quite a while and almost initiated a few fist fights!

Bill " (from sci.physics.electromag).

This has nothing to do with radio waves (electromagnetic radiation),
but there is ALWAYS a correlation between any thing. Correlation goes
from -1 to +1, passing through zero. So, yes, there is a correlation,
but it may be negative, it may be zero, or it may be positive, but it
is always something.

EM waves are transverse. The Poynting vector is the cross product of the
electric and magnetic field, by definition that results in a direction of
propagation that is perpendicular to the two fields.

> So now I know what I want. Do you agree with Dr.?

The superposition of coherent waves is a linear function.
Therefore, there is no way for the superposition process
itself to produce harmonics.

For frequency doubling to exist, there must be a nonlinear
process. The question is: Does any nonlinear process exist
between the linear transmitting antenna and the linear
receiving antenna?

I once heard a pile of tin cans talking to me. Turns out
some rusted junction in the pile of cans was detecting
the FM from the local radio station. That was a non-linear
process. Lucille Ball is reported to have picked up Japanese
CW signals through the fillings in her teeth, again a non-
linear process.

I have always heard that "13 feet, 6 inches" is a standard for the maximum height of an antenna mounted on a vehicle.

However, I cannot find a credible source on the web verifying this "fact". NHTSA, DOT, don't seem to have such an antenna regulation on their respective web sites. I am not the most skillful user of Google, but my searches have sure not turned up a reference to this magic number on any authoritative site. Perhaps there is no national standard, only 50 separate state standards, and the state with the lowest height limit would then become the 'national standard'??

Maybe for interstates but I have seen some overpasses that were lower
than that.

Jimmie

It's not a rule about antennas per se, it's maximum height of
vehicle. In California, it's 14 ft (with some special exceptions).
CVC 35250. No vehicle or load shall exceed a height of 14 feet
measured from the surface upon which the vehicle stands, except that a
double-deck bus may not exceed a height of 14 feet, 3 inches. Any
vehicle or load which exceeds a height of 13 feet, 6 inches, shall
only be operated on those highways where deemed to be safe by the
owner of the vehicle or the entity operating the bus.

There's also a federal rule for interstate highways that, in effect,
says that if your vehicle is less than 14 ft high and 8 ft wide, it
will fit on all interstate highways (if there's a low bridge, you'll
have the get off and go around path marked.

CVC 35100. (a) The total outside width of any vehicle or its load
shall not exceed 102 inches, except as otherwise provided in this
chapter.

(b) Notwithstanding any other provision of law, safety devices which
the Secretary of Transportation determines to be necessary for the
safe and efficient operation of motor vehicles shall not be included
in the calculation of width as specified in subdivision (a).

(c) Any city or county may, by ordinance, prohibit a combination of
vehicles of a total width in excess of 96 inches upon highways under
its jurisdiction. The ordinance shall not be effective until
appropriate signs are erected indicating the streets affected

I don't think there's a maximum antenna height, per se. However,
there are some standards for the minimum heights of bridges and other
overpasses.

Take a look at

http://wwwcf.fhwa.dot.gov/legsregs/directives/fapg/0625sup.htm

Specifically, section 7A specifies that sections of the Interstate in
rural areas must have a clear height of not less than 16 feet, while
some Interstate routes in urban areas can be as low as 14 feet.

I believe that the "13-and-a-fraction foot" height is intended to
ensure that the vehicle can pass along all conforming Interstate
routes without hitting anything... it's a comfortable margin below the
14-foot urban minimum. I've heard "13 feet 9 inches" as well as the
"13 feet 6 inches" figure you mention.

There are some exceptions: Interstate overpasses below the specified
minima. See

http://www.aitaonline.com/Info/Low Clearances.html

for lists.

>is more like 40 years.

Yep. We may be dead before symptoms appear.

<http://www.healthnewsflash.com/conditions/skin_cancer.php>
In addition, skin cancer is related to lifetime exposure to
UV radiation. Most skin cancers appear after age 50, but the
sun's damaging effects begin at an early age. Therefore,
protection should start in childhood to prevent skin cancer
later in life.

It's possible that brain cancer induced by RF exposure might work the
same way. At this time, there's no evidence of such a mechanism.
Widespread handheld cell phone use started in about 1990. If it
really takes 40 years to see problems, we'll just have to wait until
2030.

Here are examples that science is fuuny.
1. Browian movements. The pet theory says that not simmetrical kicking from H2O particles are the cause. But everybody should know that ALL SUSPENSION ARE CHARGED. No charge no suspension. The electrostatic is the cause.

2. Cavitation demages. The pet theory says that the colapsing of bubbles is the cause. But demages are in the area where the bubbles appear. The demages are electrochemical.

3. Photons. The pet theory says that light is particles. Everybody should know what the coherence is. Light is emitted in packets (as largely longitudinal waves)

4. The magnetic whirl ..... and many others pet theories.

Is not this very funny?

But the dipole has the two independent sources on the two ends. The waves
from them are "coupled". We can say "polarised" but it not means that radio
waves are tranversal.
>

> between the linear transmitting antenna and the linear
> receiving antenna?

Forget nonlinear process. In emmiting antenna the one current cycle produce
the two spherical waves from the ends (of course not in phase). So equipment
is "polarised" not the waves.
It is most interesting that at very short distances the polarisation works
and the frequency is not twice more.

The Pointing vector and the rest are from the fluid mechnics. There are the
whirls. Whirls had also sense in times when electricity was as
```

incompressible massles fluid. The moving electrons cause in medium stress
and strains.
The magnetic whirl around a wire is a assmption. The clasical EM is valid
only for such assumption.

The maximum allowable height rule for the CA
mobile shootouts that I attended was 12.5 feet
from the ground. Don't know if that's the CA
limit or not.

The "sources" of radiation on the two ends of a dipole
are not independent. There are coherent with the single
source. There is no way to superpose two coherent waves
to get a doubling of frequency. According to the math
model, all one gets is single-frequency interference.

EM waves in free space, "in" a wire, or in a waveguide,
propagate at the speed of light in the medium. Therefore,
the EM energy is photonic since electrons cannot move
that fast. Even the impulse current in a DC circuit
is photonic. The name "standing wave" is an oxymoron.
If its standing, it's not a wave, by definition.

An analogy might be water flowing through a pipe. One
can send information through the pipe much faster than
the water is flowing.

CA limit is 14 ft (unless you have a "moving permit")
Pilot cars can have a measuring device that's taller, as long as they
don't go slower than 20mi/hr below the speed limit. (presumably this is
in connection with the moving permit for the oversize load that's following.

Your friendly local CHP office will work out the route for you..

Yep. Using the NCI statistics I previously excavated, the incidence
of new brain and CNS cases is about 6 cases per 100,000 population per
year. The current population of Sweden is 9.2 million. Assuming the
same cancer rate in Sweden as the US, that's 552 cases of brain cancer
per year. Where did they find 905 brain cancer victims in a country
that only generates 552 cases per year? Perhaps the numbers seem a
bit odd?

I haven't read the original report, but my guess(tm) the 240% higher
risk is due to statistical anomalies resulting from using small
samples culled from extremely small incidence rates. All it takes is
one or two more events (cases), and the results look like 100% or 200%
increases.

Thanks, Dave, for the exact reference sites. They were helpful. And thanks to all the others for their replies.

I think it's clear that finding one number-- one right answer-- is difficult. I just called the California Highway Patrol office in Altadena and found that there really is no right answer. The guy at the front desk said that the "consensus" in the office was 14 feet. And of course he was speaking only for California. He said that there's no separate regulation for antennas, only the number for total vehicle height. There seems to be no urgency on the part of the CHP to refer to a vehicle code to enforce the height.

As you saw, the replies to my post ranged from 12.5 to 14 feet. It surprises me that the standard deviation implied by this spread is that large.

All in all, this has been very surprising.

Thinking about it some more, perhaps the limiting factor becomes not bridges and overpasses, but fast food drive-thrus and gas station roofs.

For one of the CA 75m shootouts that I prepared for,
I had a white PVC pipe extending up about 9 feet from
the tool box on my pickup. I was stopped by a Maricopa
County deputy sheriff who tried to give me a ticket
for violating some height limit.

I demanded that he put the law section number that I
was violating, on my ticket. After spending about an
hour on his radio, he couldn't do it and let me go.

To be truthful, I had outrun this guy on my Z1B Kawasaki
motorcycle and he was itching to give me a ticket. :-)

And parking structures.

Don't even think about going to Vegas with an antenna much over 8 feet
tall unless you plan on parking in the back 40 with the RV's.

Depending on structural integrity, that would be self-enforcing,
wouldn't it?

From http://en.wikipedia.org/wiki/Interstate_Highway_standards

Vertical clearance. Minimum vertical clearance under overhead
structures (including over the paved shoulders) of 16 ft (4.9 m) in
rural areas and 14 ft (4.3 m) in urban areas, with allowance for extra
layers of pavement. Through urban areas at least one routing should
have 16 ft (4.9 m) clearances. Sign supports and pedestrian overpasses
must be at least 17 ft (5.1 m) above the road, except on urban routes
with lesser clearance, where they should be at least 1 ft (0.3 m)
higher than other objects. Vertical clearance on through truss bridges
is to be at least 17 ft (5.1 m).

The very clear thing, at least here in Minnesota, is if you break it,
you bought it. A rig towing a large piece of equipment was a bit too
tall and struck an overpass on one of the I94 bypasses. Their insurance
company bought a nice new 4 lane overpass that traversed the 6 lane
bypass. Not cheap.

>cancer are the same thing? Hint: They are not.

Oops. You're right. The original question was about RF and cancer. I
didn't notice that the Swedish study apparently (not sure without
reading the study) includes both malignant and benign brain tumors. It
may also not include CNS (central nervous system) tumors, which the
ACI graph I presented does include.

I couldn't find the article in question due to the vague references,
but did manage to find another article on the same topic by the same
author:
"Symptoms Experienced in Connection with the Use of Digital
and Analog Mobile Phones for Poeple Using Both Transmitter
Systems: A Swedish-Norwegian Epidemiological Study."
<http://www.springerlink.com/content/k2k224/?p=414fd7433b85492a967c4624feddf2ca&pi=0>
It appears to be part of the book "Wireless Phones and Health II". I
also found a series of other articles dealing with RF exposure and
medicine by Kjell Mild, but no source for the original article under
"International Archives of Occupational and Environmental Health".

Incidentally, one of my neighbors recently had a brain tumor removed.
She didn't use a cell phone prior to the diagnosis, but bought one so
she could remain in contact during the treatment and recovery.

Caution!

As a radio amateur I must be lucky if my neighbours don't
claim headaches and nervous irritation the day after
I put up my new antenna.
Better keep oneself in good shape regarding the arguments.

I can still remember my dad (the first W3DHJ) telling the story of the night back in 1952 when he had to buy seven 8' fluorescent lamps at a gas station somewhere outside Pasco, Wash.

The maximum height for _my_ mobile antennas is 7' 1". My garage door is at 7' 2" and I know someday I'll blissfully drive into the garage someday with the 6M Halo mounted.

You will have to sign up and become registered in the ULS system (free).
Then you will be issued an FCC account number. Write this down or print it
out. You will need your FCC I.D. number any time you wish to make changes to
account profile. Your callsign will not work as a substitute.

Spend an hour patiently studying the website. Eventually you will learn how
to navigate and use the system successfully. It is worth the effort. Don't
hesitate to take notes of important tips. Good luck.

I drive my Dodge Caravan to Las Vegas and my little MFJ dual-band mag mount
hits the overhead in some parking structures. I sometimes remember to
unscrew the element on the way in.

Fast food joints often have a pipe hanging on chains as a noisy warning that
something won't clear their building.

This is a subject I have considerable experience in. My group at Eastman developed a process Raman spectrometer that used communications grade fibers to transmit both the excitation wavelength and the anti-Stokes Raman scattered light. Chalcogenide fibers, at around $1K per foot, would be needed to transmit the IR wavelengths needed for the analysis we were doing. The communication grade fibers cost less than one foot of the expensive fibers for the entire several hundred feet needed to separate the analyzer from the chemical process. Our patents were eventually licensed to the Rosemount division of Emerson Electric.

Raman spectroscopy is based on the _non-linear_ (inelastic) scattering of photons. It is quite weak; more than 100 million photons are reflected by the linear (elastic) Rayleigh scattering for every photon reflected by Raman scattering.

I am convinced now that Szczepan Bialek is nothing more than an offensive troll. It is best to ignore him as the physics newsgroups seem to have done. May he bask in his own stupidity! Or perhaps he and Art and the gays and the gay bashers could form their own "alt.troll" newsgroup.

>> consist of photons that cannot stand still.
>
> As opposed to consisting of photons that _can_ stand still? :-)

Some people will argue that EM standing waves are
actually standing still which implies that photons
can stand still which they cannot. This is easy
to see if one visualizes standing waves of light
in free space as Hecht does in "Optics". There's
no voltage or current to muddy the issue. One is
forced to deal with photonic E-fields and H-fields
in free space.

It's the same old misconception. If net energy
transfer is zero, some believe that means the
energy carriers are not moving. But as Hecht
says, it is the *profile* of the standing wave
that doesn't move. The standing wave profile
is a human abstraction and according to Hecht,
standing waves do not deserve to be called waves
at all: "They might better not be called waves at
all, since they do not transport energy and momentum."
"Standing waves" is a misnomer, i.e. they don't stand
still and they do not meet the definition of "wave".

On another newsgroup, I pointed out the above
concept of EM waves just standing there is similar
to the idea that since the number of northbound
vehicles on the Golden Gate Bridge equal the number of
southbound vehicles, there is no net traffic flow and
therefore no maintenance of the bridge is required.

For this reason it was observed very late (1928). It is seen on the film
after many hours of continued radiation.

YOU ALL make me troll. For my simple question, instead of answers, you send
questions. "Why you want to know?", "Why you write here?". I simply try to
be polite and I write.
You was the first who wrote (in the answer in my topic): "Nowhere in all of
the respected literature will you find frequency
doubling caused by the two ends of a dipole."
Till now nobody answered me why the polarisation of radio waves disappear
after long way.
Only Richard wrote that the term "polarisation" apply to an equipment. To
waves rather "polarity".
Too late for me for study. "Trolling" is more efficient. About the frequency
multiplying now I know eneugh.
About light polarisation not all. The radio waves and the apparatus are

large enough to observe this phenomenon. The Hertz apparatus is the best for
it. Of course the emitter only. To analise the waves is necessary more
sophisticated than the ring.

> the tool box on my pickup.

On the truck with the highest antenna mount, "64 inches
from the ground", my 11 ft tall antenna is 16.3 inches at
the tip. In the parked mode with the extra 3 ft mast extension,
it's at 19.3 inches. And the loading coil is 8 ft above the
base.
The other truck has a lower mount which is maybe 1.5-2 ft lower
at the base of the antenna. It's mount is on top of the utility
bed side tops which are tool boxes, and fairly wide.
The first truck has the mount up on the cab just a few inches
below the roof.
But.. I've been trying to sell that truck.. :(
But I could place the mount at the same place on the other
one if I really wanted to. I might once the other one is gone.
One thing.. my antenna sways back a bit at speed, so I
can clear objects lower than the actual antenna height if I'm
going fast enough. The most seen problem is whacking
trees in residential areas.. I have the mount on the drivers
side, and I still have to dodge some of the trees. Some
I can't dodge, so I hear the "whack".. But the top 5 ft is
thin flexible whip, so no big deal.
I don't think I've ever noticed hitting a bridge or overpass.
I've still been too chicken to try to mount an antenna on
my Corolla... Not too many ways to go, and most all
of them will end up buggering up the car before it's over
with. :(

One other thing to think about, what with all the quotes from the
federal standards..
The states don't have to follow the standards for ALL roads. A state
can say "on federal highways the limit is X, but on all other roads
it's Y (where Y<X)". For that matter, in some states, local
municipalities can set different limits. This makes for nice revenue

enhancement opportunities. "Well son, here in X, the limit for semi trucks is 15 feet, but for funny looking antennas on cars with funny license plates, it's 8 feet. Please step out of the car and keep your hands in plain sight."

A friend ran into this distinction (except for it being width) in, I think, Nebraska (somewhere in the great plains)... Federal standards are 108 inches, local rule is 96.. and there are difference in whether you count rear view mirrors. If only he had stayed on the interstate.

The effect seems to peak at about 75 meter wavelength, with a minor peak at about 2 meters. The cautious and same amateur will avoid exposure to those wavelengths.

Certainly a far cry from the idea you tried to sell on this newsgroup
that interference patterns cause northbound vehicles to move in a
southbound direction and southbound vehicles to move in a northbound
direction.

There you go again, Jim, continuing to blame me for a poor choice of words that, at your urging, I recanted more than a year ago. I rewrote my energy article to remove any reference to interference as the cause of anything. The footnote says: "...since interference can occur with or without wave cancellation, any reference to interference as the cause of the redistribution of energy has been removed."

Exactly how long can you hold a grudge about a poor choice of words that was corrected long ago at your urging? Would you like for me to change it back so you can justify continuation of your incessant compulsive bitching?

Or is it that you still don't understand the FSU web page?

micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveinteractions/index.html

"... when two waves of equal amplitude and wavelength that are 180-degrees ... out of phase with each other meet, they are not actually annihilated, ... All of the photon energy present in these waves must somehow be recovered or redistributed in a new direction, according to the law of energy conservation ... Instead, upon meeting, the photons are redistributed to regions that permit constructive interference, so the effect should be considered as a redistribution of light waves and photon energy rather than the spontaneous construction or destruction of light."

That redistribution of energy cannot happen without interference. For the umteenth time, I apologize for ever saying that interference causes the redistribution. If you will mail me a Xerox of your posterior, I will kiss it and send it back to you if that would help.

Here is how Hecht defines "interference" in "Optics":

"Briefly then, optical Interference corresponds to the interaction of two or more lightwaves yielding a resultant irradiance that deviates from the sum of the component irradiances."

Sure sounds like interference corresponds to (rather than
causes) the redistribution of photon energy as described on
the FSU web page.

All of which means it is a good idea to have a pulley system to both guy a long antenna and quickly retract it like you see on mil vehicles. I have had to go out and remove an 800 spike when entering parking garages, so it is a good idea to make those mounts easily accessable. I like to put them where I can reach them from the driver or passenger door. KNOW YOUR CLEARANCE! I often use an old expendable CB whip for HF reception and go out and swap antennas when I want to get on the air.

:-) Why are there never any examples provided to support these
'suggestions' of yours?

So now you minimize the fact that you argued vehemently with everyone
for endless months over your malformed ideas about how energy moves in
impedance matching systems. After I found the Melles-Griot web page
which seemed to support your idea, I realized the idea was physically
impossible and tried to persuade you away from it. I let you know in
every way I could that you had it wrong, and gave you every possible
example of it that I could think of, and in the process you called me
every nasty insulting thing you could think of. So yeah, I guess I do
have a tendency not to overlook it as easily as you do.

> If

Yes it does. In fact that's one of the many ways I explained it to you
back when you wrote about how stupid, ignorant, and wrong I was about it
and how everyone from Galileo to Eugene Hecht agreed with you. What I
don't recall is ever seeing you take any of that back.

Yeah, I've seen it that way, too.

Years ago, I manged to run the right front corner of my pickup camper into
an overhanging tree branch. No, not at 2AM with a snootful. It was
noontime and I was pulling out a parking space in front of the post office.
That tree would have been an antenna-killer.

I apologized over a year ago and changed my article.
Exactly how long are you going to harass me about
a poor choice of words that I used in the distant
past for which I have apologized multiple times?

There was nothing wrong with the ideas and concepts
which have always been valid. The problem was with
the definitions of the words I was using, i.e. 100%
semantic.

I was using definitions of "reflection" and
"interference" that differ from the pure physics
definitions. I have admitted it and changed all my
articles. Do you want me to go to the nearest
police station and confess my semantic capital
offense or just go sit in the electric chair and
wait?

> No, but an admission that for months you behaved like a horse's
> posterior would.

I will admit to treating you the way you treat me.
Whatever ad hominem label you choose for your harassing
behavior is OK with me. But it is not clear why you
continue that same harassment years after I have repented
of my cardinal sins, been forgiven by God himself,
apologized to you multiple times, and changed my articles
at your urging.

Do you continue to kick your poor dog after he stopped
wetting the floor more than a year ago?

Ham radio has its very own industry specific cancer called "cancer of
the vocabulary". Upon over-exposure to RF, a fairly normal individual
will soon develop symptoms which include ultra-long monologs,
inserting "ahhhhh" between sentences, foaming at the mouth, phonetic
alphabet creativity, and an apparently irresistible urge to eat
microphones. An early indication of impending trouble is a tendency
to identify oneself with a call sign after leaving a voicemail
message. Advanced cases exhibit additional symptoms of language
aberrations, political conservatism, compulsive knob twiddling, an
insatiable desire to listen for intelligence in random white noise, a
preference toward high wire acrobatics, and strangely coded speech.
After several decades of RF exposure, the victim may show symptoms of
pontification, pomposity, self-authority, and ossification of the
technology. While not fatal, cancer of the vocabulary has been known
to cause divorce, impoverishment, and curmudgeonificiation.
Unfortunately, the symptoms are not reversible, even when the victim
has withdrawn from ham radio for extended periods, such as to raise a
family.

Despite almost a century of historical data, little effort has been
made to correlate RF exposure with cancer of the vocabulary. I
suspect this may be due to the efforts of the ARRL to block such
research. While it is obvious that different frequencies had
different effects, it would be both interesting and useful if the
connection were properly researched and documented. For example, it's
apparent that exposure to low frequency (HF) waves causes a marked
preference for noisy environments, the exact opposite effect is found
after exposure to high frequencies (VHF), where signal clarity is

preferred. This phenomenon and others should be investigated.

Obviously you've never been interested in weak signal V/U/SHF or EME.
These tend to lead to shack environmental noise levels approximating
WWII destroyer engine rooms. Another side effect is hearing CW in wind
noise when driving at over 60mph.

I've done a little of that at VHF frequencies using various digital
modes. I was considering organizing a new certificate for "Worked all
Digital Modes", but every time I add a new mode to my computah,
someone invents yet another digital mode.
<http://www.kb9ukd.com/digital/>
<http://www.wb8nut.com/digital.html>
With weak signal digital modes, there's no way to actually hear the
signal as it's well below the noise floor. Waterfall displays work
nicely for copying extremely slow CW. It's a little like modern
astronomy. Most astronomers never look through the eyepiece of a
telescope these days.

Although I'm not a CW operator, when I was into Field Day, it took
several days for me to NOT listen for weak signals under the noise of
conversation, traffic, AM/FM radio noises, etc.

Well, the June VHF QSO Party is in about 3 weeks. Try some non-digital
weak signal. It's fun! I'll be the primary op on our 6m station
running under the club call W0AUS from EN34. No high power this year
since we'll be within LOS of the Twin Cities metro at maybe 300 feet
above local average terrain. We'll be multimulti 6 through 10G,
probably all bands.

I've done some of the digital modes. High speed meteor burst, MFSK, and
PSK31 - really weak stuff with power as low as 50mW back when almost no
one was on it. My personal favorite is Hellschreiber, it's the oldest
(as far as I know) and sounds so cool.

>

Yup, after 24 to 40 hours of noise with embedded weak or even not weak
CW and SSB and almost no sleep, you start to hear lots of things.

Price:$275.00
Image: http://bestdeallocator.info/image.php?id=B000ZPOWJA
Best deal: http://bestdeallocator.info/index.php?id=B000ZPOWJA

Adorned with sparkling crystals on its bezel, the Palidoro #EG2500-57A from Citizen's solar powered Eco-Drive Collection is truly stunning. A rectangular, silver-tone stainless steel case and bezel surround an understated white dial, complete with silver-tone hands and Arabic numeral hour markers at six and 12 o'clock. There's also an intricate link bracelet band that looks cool and sophisticated in its silver tone, and a deployment clasp with push button for secure, comfortable wear. Water resistant to 330 feet, the Palidoro comes with a five warranty.

The sophisticated Kenneth Cole New York Men's Explorer Collection Leather Watch is designed with a rectangular dial, which features two unique subdials that track the minutes and seconds. The timepiece is constructed with a stainless steel case, a stationary stainless steel bezel, and a black, polished reptile-pattern leather wristband with a buckle clasp. A strong mineral window shields the gray dial, which features silver-tone hour markers paired with discreet Arabic numeral hour indexes. The dial also includes silver-tone watch hands and the watch's two dark gray subdials. Powered by Japanese-quartz movement, the watch is water resistant to 99 feet.

Best deal: http://bestdeallocator.info/index.php?id=B000IZAWFU

I have numerous schedule appointments during the day, and I prefer not to use the cell phone alarm feature as it's too distracting. The alarm function of the watch is personal. This watch is not nearly so dreadful as what other reviewers have whined about. Au contraire!

1) Accuracy -- I set this watch when I got it as a pre-Christmas present in November. It has varied only a few seconds since.

2) Alarm accuracy -- I don't see the problem. It's an analog dial, for Heaven's sake: not a precise cesium-clock, digital instrument. Like MOST ALL analog dial settings, the alarm is going to go off "in the close neighborhood" of where the hand is placed. This is exactly what I expected (and the other buyers should have expected), and that's what this watch delivers.

3) Alarm volume -- yes, it's not loud enough; I agree. -1/2 star

4) This is a VERY attractive watch. I've had lots of compliments, which is why I got it -- an inexpensive dress watch. The SS watch face has a VERY attractive metal "graining" to it that starts in the center and then spreads outward. Eye-catching is an understatement; whoever the design artist was for the face deserves a pay raise.

5) The only other complaints that makes me drop it to 4 stars is that it's too "tall" for my wrist and doesn't sit completely flat. This could be remedied by a redesign of the leather strap joint to the watch. But it's no big issue, and it's perfectly comfortable. The second complaint is that I don't have a huge wrist (see early in #5 here), but yet the leather strap is too short for all the "keepers." I don't understand this design problem, but it fits perfectly well, and there is PLENTY of room on the band for expansion. It's just that the keepers are somewhat useless, but they're on the bottom of the watch, so who cares?

If you're going to buy an $80 "dress watch," know what to expect, and you won't be disappointed. The only serious negative thing I have to say about this watch is the low alarm volume. Otherwise it looks gorgeous, and few people know how little it costs. It's a keeper, definitely.
This is a nice looking watch. I've had it for about a month now and it keeps perfect time. I have received numerous comments on how attractive it is. Overall a great watch for the price.
This watch is huge and bulky. Unlike all the other Skagens I own. The alarm function is not very accurate. Even if you try to set it on the hour, the alarm will go off 6-8 min before or after the set point. Alarm not loud enough.
nice styling - now if it only kept time. cannot compare with less expensive timex.
Quartz movement, Casual watch, Alarm, Silver-tone luminous hands, Silver-tone numbers and

indices, Brushed stainless steel bezel, crown, case, alarm selector button and caseback, Super hardened mineral crystal, 30 meters/100 feet water resistant
Dress to impress and keep yourself on schedule for important appointments day and night with this Skagen stainless steel men's analog watch, which offers an alarm function that's denoted by a red-tipped alarm hand. Sophisticated and modern in style, its large, 40mm round watch case elegantly flows into the integrated, tapered brown pebble leather strap (featuring tonal stitching). The silver dial face is supplemented by a mix of shiny stick and Arabic numeral markers along the outside edge as well as small minute indexes and luminous hands (with seconds hand). Other features include Japanese quartz movement, a scratch-resistant mineral crystal, and water resistance to 100 meters (330 feet)--offering protection from accidental splashes as well suitable for swimming, snorkeling, and light recreational diving. About Skagen Named after a fishing hamlet in Denmark on the northern tip of the Jutland peninsula, Skagen Designs was founded by Henrik and Charlotte Jorst in 1991 after the two Copenhagen natives moved to New York City. The company subscribes to the principle that beautifully designed, high-quality objects can be created at reasonable prices. Skagen watches represent the technical excellence, refined design and operational simplicity that have created the unique reputation of Danish design. The fishing village of Skagen--the Skaw--lies where the northern-most tip of the Danish peninsula known as Jutland bends East and breaks the surging waters of the Kattegat and Skagerak seas. The spectacular natural beauty of the area is compellingly beautiful, and its white sandy beaches have been visited by artists for centuries.

A twist of modernity with a touch of style. This Officina Del Tempo timepiece will collectively match any suit for a night out in town.
Casual yet refined, this Officina del Tempo Tonneau Men's Big Date Watch transitions nicely from the work week to the weekend. It features a mix of brown Arabic and Roman numerals against a silver dial, luminous hands, a 60-second sub-dial at the six o'clock, and a big date display at the twelve o'clock. The stainless steel cases measures 40 millimeters. The brown pebbled leather strap fastens with a push button fold-over clasp. Powered by an analog quartz movement, this watch is water resistant to 165 feet.

This is a great watch and looks awesome on the wrist. It's not too big like some other square watches, but just the right size. The only warning is do not try to change your own links. I spent an hour attempting to change these and bent all of the pins I removed. I took it to a certified watch repair store and they had it fixed in no time. I normally do all my own adjustments, but these links are tight and the pins are not that strong. Other than that, fantastic watch! Enjoy!
Sleek, stylish and uniquely British. A Triumph Motorcycles watch demonstrates the same high quality and design philosophy that has made their line of motorcycles an international classic. SmartBargains Style #6018380383
Triumph Motorcycles Tiger Chronograph Leather Strap Watch #3025-11 adds a distinctive element to any man's wardrobe. Designed to highlight the simple, classic elegance inherent in all precision-engineered machines, this watch offers a black dial with two subdials, a circular second tracker with subtle white markers, a convenient date window at six o'clock, angular stick indices, and three hands for easy reference. Also featuring a tonneau case and bezel crafted from stainless steel plus a stainless steel bracelet band that is held in place by a deployment clasp, this timepiece offers a pleasant weight and feel to go with its sophisticated styling. This watch is powered by reliable Japanese quartz movement is water resistant to 330 feet.

It does what it says - cooks tasty food reliably.
My chief reason for getting it was to lower my energy use. My oven is dandy, but often overkill for just 2 people. This is a fine replacement, and I love being able to start with a frozen game hen, and have a yummy dinner on in less than an hour.
I was hesitant to by the nuwave because I was afraid it will be a new addition to the "never use appliance salvage yard "in once house.
Boy, was I wrong!
I needed this for a replacement for my malfunctioning built-in-oven.The Nuwave bakes cakes in my regular metal springform. You have to experiment with aluminiumfoil-covering to make sure it cooks all the way through the center without getting too dark. It makes the most delicious chicken that can rival the fanciest rotisserie chicken.The machine will hold two 3 pound chicken placed next to each other.Steaks and sausages are to die for.Just be prepared to adjust cooking times. My experience is to almost double the posted Nuwave cooking time. But, if you want quick cooking use the microwave.The most delicious outcome with this oven is the hit. A tip, do not pour water in the metal dripping pan to catch fat drippings (wanted to make even easier clean up) the circulating water vapor will make for a soggy chicken skin. If you do not use the water it will be perfect. I made casseroles and transferred the 9x13 recipie ingredients in two 9x9 glass dishes. Place on 1" rack and the 4" rack above it with the other dish. Rotate after half cooking time. Super casseroles that way.The plastic dome can be wiped clean with a wet cloth on the inside.You do not have to remove the heating element and rinse the plastic dome unless it becomes really dirty. Next will be to teach my kids (11 & 14)to use it since they do not have to handle a hot frying pan and oil splatters.
better than an oven or microwave. Is the best cooking device i have ever used.
I am really disappointed with this oven. I cooked frozen boneless (skinless) chicken breasts. The flavor and texture was not very good (compared to regular oven), especially considering that it didn't save that much time. It is a bulky unit and everything needs to be taken apart and cleaned each time. I don't have to clean inside my regular oven after baking a chicken. My local Fox news channel did a special "Deal or Dud" report about the Nuwave ovens on their broadcast the other evening. They determined to product to be a "dud". Save your money!
I am not familiar with the NuWave oven, but I am familiar with Hearthware by way of another of their products, their coffee roaster. It is a reasonable coffee roaster although not very well constructed for what it costs.

The problem is with their customer service. It took them a month to send me the wrong part. When I called up after a couple of weeks to ask where the part was, they lied to me about when it had been shipped. It had in fact not been shipped at that point. They did agree to send the correct part UPS, but it still took them seven days to ship it.

The owner of the company did not reply to a letter complaining about the customer service. An exchange with a retailer who sells one of their products confirmed that their customer service is routinely atrocious. In spite of this, Hearthware will not allow the extremely efficient retailer to sell their parts. Hearthware won't supply their parts with any efficiency, and they won't let anyone else do it either.

The owner of the company does not seem to care what the customer service is like, and that is a big red warning flag. (Customer service, by the way, refused to give me the name of the owner. It was, of course, easy to find.)

I don't know what the oven is like, but I do know that if you have a problem with it or need a part for it, you are screwed.
The Nuwave® Pro Infrared Oven is designed to produce succulent meats, poultry, and fish. The Nuwave® Pro quickly and easily cooks foods while keeping them moist on the inside, crisp and browned on the outside with out using any fats or oils. The Nuwave® Pro cooks most foods up to 50% faster than a conventional oven, without preheating or defrosting, for the best in flavor and taste. The Nuwave® Pro Infrared Oven works with a patented trio of cooking methods: Conduction to apply heat directly to food, Convection to circulate the heat around the food, and Far Infrared radiant heat to penetrate the food to cook from the inside out, leaving food moist and Flavorful. The Patented Triple Cooking Process of infrared, conduction, and convection enables the following cooking methods: Barbeque, Roast, Air Frie, Broil, Bake, Steam, Dehydrate, and Grill all without preheating or defrosting. The Nuwave® Pro Infrared Oven saves you up to 50% in cooking time and saves up to 85% in Energy compared to a conventional 3500 watt oven. This tabletop infrared oven comes with an extender ring kit which includes a 3 extender ring, a 2 stainless steel cooking rack, and a 10 micro ceramic backing pan. Includes owner's manual, quick & esy cooking guide, recipe book and low-carb diet recipe book. The extender ring allows for cooking of up to a 16lb. turkey. The Nuwave® Pro Infrared Oven comes with a limited 1yr. warranty and the Hearthware Home Products customer service department can be reached at: 1-888-287-0763 or 1-847-566-3009.

Some will probably be skeptical, but I've actually felt the effects
of
RF when operating on the HF bands. I forgot what band it was, but
it was one of the lower ones, "80 or 40", and I was working CW from
my mobile. "parked"
It took a QSO or two before I realized the RF was effecting me.
But I noticed I was starting to feel funny. It's hard to describe the
effects. But I noticed I didn't feel quite right, and it was an
uneasy
queasy type of feeling. Then I started to notice that the feeling
would
subside when I quit transmitting and was listening to the other
station.
When I would go back to transmit, I would slowly start to feel weird
again. I then kind of decided it was the RF hitting me from the rear
of the car, through the window. That particular car was a monte carlo,
and the antenna was on the trunk, with the loading coil fairly low.
So a lot of RF was beaming into the back of my head due to the
location of the antenna. I was running the usual 100w.
So anyway, I don't know about any cancer dilemma, but I know
in some cases, it's possible to feel RF on the HF bands.
Or at least I seemed to..
I didn't like the feeling of it at all. Was not a burning or anything,
it made you feel real nervous and uneasy. Pretty weird.. :/

3225. ATU: Correct way to specify impedance range

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-21 14:28:25 UTC

Source record: 15493

Hi to all,

Just got my new ATU. The specs mentionned:

Tunes 6 to 600 ohms (about 10:1 SWR range). 16 to 150 on 6M (about
3:1)

It sems that this is the standardized (?) way to mention
specifications...

But, since impedances have both a resistive and reactive compoment,
doses it means 6 to 600 Ohms "resistive"?

For example , if Z= 500-J800 ohm, is it 'tunable'? I have a doubt
because the impedance could also mean sqrt(500^2+800^2)=943,4 Ohms..

Thanks de Pierre ve2pid@videotron.ca

Only the manufacturer can tell you what they mean. It would be
interesting to see what they say when you ask.

At Texas A&M in the 50's, we had a radar in the
EE building with the antenna on the roof. Once,
someone was working on the antenna when someone
else turned the radar on. They rushed the guy
on the roof to the hospital in an ambulance. I
don't recall the rest of the story.

I once emailed a tuner company (don't recall which)
and asked them about their specs. They told me that
their ohmic specs were for resistive loads. They
didn't say where one would find an antenna with
a 600+j0 feedpoint impedance - maybe a 4-wire
folded dipole?

It would be good if they plotted the range on something like a Smith chart. It should be done for different frequencies; it's rare indeed for a tuner to be able to match the same range of impedances over its frequency range. Some tuner topologies even have "holes" in their coverage.

Icing on the cake would be some additional lines on the Smith charts showing the expected power loss, perhaps as constant-loss contour lines. Many (most? all?) tuners get pretty lossy at some adjustments.

As far as I know, none of the ham manufacturers do that. I expect it, though, for commercial equipment, and we ought to hold the ham manufacturers' feet to the fire to do something similar.

Cheers,
Tom

I suspect their average amateur radio customer
doesn't understand the meaning of 1000+j1000
much less comprehend graphs on a Smith Chart.

I recently published an article over on eHam.net
that contained a Smith Chart. One of the reactions
was that Smith Charts are obsolete and have been
replaced by software programs that just provide
the answers without all the effort and pain involved
with understanding a Smith Chart.

One doesn't need to know anything about hyperbolic
trig functions any more. Just point and click.

Hello Cecil,

I was expecting that this only happens in the Netherlands. I have some (modern) software where the default plot method is Schmit Chart...

I agree with the contour plot on a Smith Chart showing losses (and power handling) for Antenna Tuners.

Best regards,

Wim

Well, a little Googleing found the missing maker and model number.
It's obviously made by LDG but which product?
<http://www.ldgelectronics.com>
The spec sheets aren't any more useful. I'm also rather suspicious
because ALL their products, regardless of size or technology, have the
same specification.

Well, if all else fails, I guess I have to read one of the manuals:
<http://www.ldgelectronics.com/assets/manuals/Z-817Manual.pdf>
No help in the Theory of Operation section.
The manual has a slightly expanded specification:
"Tunes 6 to 600 ohm loads (16 to 150 on 6M), 24 to 2400 ohms
with optional 4:1 Balun."

My guess(tm) is that they're refering to the vector sum of the complex
impedance, which is what one ends up measuring on a VSWR guess-meter.
Disclaimer: This is only a guess.

As for the proper way to specify antenna tuners, I vaguely recall a
marine band antenna tuner that we sold at Intech in the 1970's. (Not
my project). The matching range was specified as anything that landed
inside a constant VSWR circle on a Smith Chart and was limited to a
conservate 8:1 VSWR range. It also excluded any resonant antennas,
which would automatically fall outside of the 10:1 range. We also
derrated the maximum power handling spec at the 1.6MHz end to avoid

high voltage flash over. I'll dig through my box of old Intech data
sheets and manuals later and see what I can excavate.

Meanwhile, call LDG and ask.

SGC used to publish the capacitance and inductance range of their
tuners from which you could calculate what it would do at a specific
frequency.

I haven't looked in a long time so I don't know if it is still there.

for a tuner to be able to match the same range of impedances over its frequency range. Some tuner topologies even have "holes" in their coverage.

This is why it is so pointless to specify the resistive SWR range. It is really only an indication. If your antenna system winds up with an impossible match at some frequency, you need to try something different anyway or suffer loss or damage. Hope the autotuner algorithm knows how to deal with that.

There was a QST test review years ago that compared several popular tuners. Old and new.

Since the points plotted on a Smith chart are simply complex
reflection coefficient plotted on a linear grid, it would be fine with
me if they'd just plot the range of complex reflection coefficient
over which the tuner will operate (perhaps plus contours of constant
loss and power handling ability). The graphs would look identically
the same, except for the grid. I don't suppose any more hams
understand complex reflection coefficient than understand Smith
charts, though.

The Smith chart, to me, remains a very valuable _visualization_ tool.
It matters not how the points on it were calculated or measured. I
think it will always be the case that information properly presented
graphically will generally be easier to understand and easier to draw
conclusions from than information presented in text in tabular form.
Some graphical tools, such as the Smith chart, are worth getting to
know, even if you don't use the chart itself to do calculations,
deferring instead to other calculators for that part. Pictures,
often, are worth much more than 1000 words.

Cheers,
Tom

Here's a recent posting of mine from eHam.net:

>> someone wrote: There are very few people out there that
use the Smith Chart.

I'm not suggesting that they actually use a Smith Chart - just that they learn how to use one and keep the Smith Chart in their heads as a conceptual tool. With a conceptual image of a Smith Chart in their heads, they not only know what the input and output impedances are but also the path the impedance took to get from one point to another. Did the SWR spiral cross the 50 ohm circle or the 1/50 mho circle during its transition? If so, matching to 50 ohms is a one component piece of cake.

I believe you. I have felt the effects of using a cell phone for an extended time. A warmth sensation. And not the batteries.

What I see as the problem with the whole situation is that there is a whole spectrum of effects that are tested for. Most are found to be lacking in evidence. The likelihood of say cell phones as a cause of cancer is quite low.

In addition, a lot of people who think that RF exposure is terribly bad are naught but kooks.

But those are not reasons to dismiss any and all effects as nonexistent.

I personally suspect that excessive near field RF exposure at cell phone frequencies makes people stupid. I used to think it was temporary, but there has to be a reason for driving while text messaging.

Probably if I hadn't had the following experience, I would think you were kinda loony, Jeff. But I know exactly what you describe.

Several times in my 4th semester in college a good friend and myself would ditch English class and drive up to Mt. Wilson, the mountain peak above Los Angeles where almost all of its radio and TV antenna installations are.

There have to be several megawatts of VHF and UHF ERP up there.

Each time we made the trek in his Pinto station wagon, almost as soon as we rounded the final bend at the top, I would start to feel nauseous. I couldn't stay up there for more than a few minutes, and for several hours afterward I would have what I came to call an 'RF headache'-- a dull, debilitating haze that affected my focus and appetite. I don't know how anyone who has to work up there does it, having to live in that environment.

From what I understand, there is a pretty solid set of data now collected that extended use of cell phones actually does cause high frequency hearing loss! That from the effects of the RF on the little hairs and the sensors they drive which let the human hear sounds. I've seen comments that there is now a pretty much 100% proof that this does happen. Which does make a bit more practical sense for I suspect most of us here. In the case of cell phone (or equivalent RF use, such as Blackberry or wireless headset stuff), I think most folks here could suspect that the VHF frequencies involved would make a lot more practical sense for this thought than HF and so on...

Of course more than 20 minutes a day of greater than 85DB over room reference quiet level of any audio sounds, especially the BOOM, BOOM, BOOM of base in songs and such, also produces permanent hearing loss for the person involved over time. And with what also goes on in the automobile use for people seems to include boom box issues as well as cell phone issues for many folks. So one would also wonder to what extent either of these two motivators for hearing loss might conflict with research work into such things.

Please watch the attributions. I didn't write that quote.

>Several times in my 4th semester in college a good friend and myself would
>ditch English class and drive up to Mt. Wilson, the mountain peak above Los
>Angeles where almost all of its radio and TV antenna installations are.

I spent quite a bit of time up at Mt Wilson in the late 1960's. I
certainly had RF effects, but the causes were obvious. My teeth would
hurt. What was happening was the metal in the fillings was getting
slightly warm. The lousy job the original dentist did left a gap
under the filling, which was full of air, bacteria, crud, whatever.
Heat up the fillings, and the air tries to expand. If it hits the
nerve, my teeth would hurt. This went on for several years until I
had some removed and replaced with the unleaded variety.

I also have a small stainless plate where my skull was fractured while
I was trying to play gang member (at age 14). I eventually outgrew
the plate and had it replaced with a plastic and fake bone version.
The RF induced pains magically went away.

>There have to be several megawatts of VHF and UHF ERP up there.

Most of it goes over your head as the antenna patterns are towards the
horizon, not under the towers. Even so, there's still quite a bit
floating around.

I didn't worry much about the RF. It was the falling blocks of ice
when the TV station xmitter baby sitter didn't bother turning on the
de-icer until the VSWR climbed. By then, there was quite a bit of ice
on the antennas. Nothing like big ice blocks falling from 500ft to
ruin my evening. Most went right threw the corregated steel roof on
the commercial radio buildings that sat under the towers. The blocks
didn't do much damage to the radios, which were in racks and boxes.
However, it did a great job of peeling off all the coax cables and
control wires.

>Each time we made the trek in his Pinto station wagon, almost as soon as we
>rounded the final bend at the top, I would start to feel nauseous.

Probably the fumes from the Pinto. In college, I worked part time for
a local Ford dealer fixing electrical systems in mostly Pintos and
Mavericks. I'd say you were lucky to have made it up the hill.

>I
>couldn't stay up there for more than a few minutes, and for several hours
>afterward I would have what I came to call an 'RF headache'-- a dull,
>debilitating haze that affected my focus and appetite. I don't know how
>anyone who has to work up there does it, having to live in that environment.

Probably different people have different sensitivity levels. I spent
about 8 days up there helping with a messy install. I never felt
anything exept some altitude sickness (at 5700ft) which affected my
sleep. However, that was in the 1960's, where there were far fewer
xmitters on Mt Wilson. These days, you could probably heat your lunch
by simply waving it in the air.

Best deal: http://speialdiscountfinder.info/index.php?id=B0010TAFVE

These sandles are a little nicer in appearance so I can wear them to work but still give me the comfort I desire. Love them.
Can't beat the price I paid on authentic birkenstock. Loved the free shipping too! Received very quickly and extremely happy with my purchase!
I love these sandals. As with all Birkenstocks, they conform to your foot resulting in great support and amazing comfort. I also really like the design - in my experience, Birkenstocks look really bulky but this design makes that bulk seem a little more feminine.
Was a little unsure of getting non-Arizona Birks (i've previously had 4 pair), but i love these! They are a little dressier than Arizona, maybe for a dressier and more mature me (lol). And the new, soft footbed is lovely.
These sandals are comfortable! The suede strapping is soft and looks to be very durable. My feet don't "slip" around in them. A good fit. Nice arch support also. They don't have half sizes, so go up one full size if needed.
Slide these gorgeously crafted Pisa sandals on for a day of sublime relaxing comfort. Soft suede upper in a casual outdoor slide sandal style with a round open toe. A wide asymmetrical interlacing suede vamp and wrapped 1 inch cork midsole shows off pretty peep detail. An adjustable buckle instep strap secures fit. Leather lining and cushioning suede topped cork and latex foam footbed with a deep heel cup and raised toe bar. EVA traction outsole. 1 inch heel.
Stay carefree and comfortable with the Pisa sandal by Birkenstock. Silky suede straps and an open toe create a breezy, laid-back style that pairs perfectly with warm-weather casuals. The Pisa also features the designer's classic cork footbed with a shock-absorbing EVA sole that cushions every step and a flexible outsole for traction and stability. An adjustable strap at the top of the foot provides a custom and secure fit.
Stay carefree and comfortable with the Pisa sandal by Birkenstock. A uniquely cut upper is balanced on the iconic and comfortable, suede-lined footbed.

3249. Stanley 45-013 Folding Square

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-22 09:17:06 UTC
From: Arnst@clarine.com
Message-ID: <4a164358$0$4897$ec3e2dad@news.usenetmonster.com>
Source record: 15369

Price:$34.99
Image: http://thediscountdatabase.info/image.php?id=B000051WTH
Best deal: http://thediscountdatabase.info/index.php?id=B000051WTH

I tried using the square for laying out tile. The square was set in place and a laser layed against it to project a layout line the length of the room. When I got different lines on different tries - over an 1" variation over 12' - I investigated. The problem is the hypotenuse of the triangle is in two pieces to accomodate folding. The locking mechanism allows some flex - and it doesn't take much to throw a projected line off.

I sucked it up and spent the $$$ on the Hansen. It's arms are all single pieces and they lock tightly. It doesn't fold up as small but it was dead on.
I do a lot of volunteering for Habitat and when I first pulled out this tool, they all laughed. I used it to check the interior walls .. and especially the ones in the kitchen and baths. It is just the right size for those locations and much more acurate than a framing square. The volunteers who put in the countertops worshipped at my feet when for the first time in the affiliate's history, they did not have to hack and cut the countertops to get them to fit!
Fits nicely in my Empire level case.
this layout tool works well and folds to a 4 foot long bar that takes up little space. From time to time I have always needed a longer square, for floors, adding a deck and other projects. This is a nice tool for all of that and more.
Very handy for exact right angle work in shower construction, tile, cabinets, etc. Nice folding action for storage.
4' x 4', Aluminum Folding Square, 90 & 45 Degree Angles For Versatility Of Job Applications, For Use In Tiling Floors & Patios, Cabinetry & General Layout, Durable Yet Lightweight Aluminum Construction, Easy To Fold & Store, Hang Hole For Easy Storage.
The Stanley Folding Square is a compact tool that provides 90-degree and 45-degree angles for a wide range of job applications. This tool unfold to a complete isosceles triangle, making it perfect for tiling floors and patios, cabinetry and general layout. Built with durable yet lightweight aluminum construction, this tool won't rust, is easy to fold and includes a hang hole for easy storage. This product measures 4- by 4-inches and is backed by a limited lifetime warranty.

3255. New Regulations for Amateur Radiocommunications in Portugal.

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-22 14:47:51 UTC
From: CT1FBF <ct1fbf@sapo.pt>
Message-ID: <716e9f05-3eb5-4457-b375-1a6e959239e0@b1g2000vbc.googlegroups.com>
Source record: 15379

The approval was given by ICP-ANACOM to the procedures governing the amateur and amateur satellite services, as set out by Decree Law n.º 53/2009, March the 2nd, relative to Regulations for Amateur Radiocommunications in Portugal (ruling from June the 1st, 2009 on).

While establishing a communication, the amateur must observe the following procedures:

a) Identifying the station's call sign (CS) in the beginning and also at the end of any call (transmission);

b) When using a transceiver from a non-proprietary station, the amateur must identify the signal according to a), using the operated station's call sign, followed by his own station's call sign;

c) If the station in use is a mobile one, the amateur must identify the transmission with the station's call sign, followed by the word "mobile", right after, and point the present location of the station under operation.
In alternative to the word "mobile" the symbols "/M" can be used in addition to the station's call sign.

d) If the station is a portable one, the amateur must identify the transmission with the station's call sign, followed by the word "portable", right after, and point the present location of the station under operation.
In alternative to the word "portable" the symbols "/P" can be used in addition to the station's call sign.

Anytime a foreign amateur establish communications within the Portuguese territory under a "CEPT" license, the original station's call sign must be preceded by the prefix:

a) "CT7" if the operated station is located anywhere inside mainland PORTUGAL borders;

b) "CT8" if the operated station is located in one of the AZORES archipelago Islands;

c) "CT9" if the operated station is located in one of the MADEIRA archipelago Islands.

Anytime a foreign amateur establish communications within the Portuguese territory under a "CEPT novice" license, the original station's call sign must be preceded by the prefix:

a) "CS7" if the operated station is located anywhere inside mainland PORTUGAL borders;

b) "CS8" if the operated station is located in one of the AZORES
archipelago Islands;

c) "CS9" if the operated station is located in one of the MADEIRA
archipelago Islands.

There is no question that at some level, tissue heating is noticeable, and I can attest that RF burns tissue at higher levels. When working in the near field of antenna farms this helps you to determine where you should linger and where you shouldn't. Some people linger in the sun too long. Some people are more sensitive to tissue heating than others. Still, after working in the near field of 900 paging antennas with ERPs of 1 to 10 kw, along with numerous other antennas it is hard for me to imagine that a 300 mw cell phone could even be sensed, let alone cause damage. I have seen people who actually complain of RF symptoms with the power off, even in anguish as if in pain or being tortured, conviced that they were being exposed, while thinking nothing of it when they actually were. It would seem to me that a great many people are highly suggestable as evidenced by the changes in our society to conform to media demoralization. There is even commercials for HULU that makes great light of this. Yuri Bezmenov, who defected from the KGB in the 70s warned us about their constant and unrelenting demoralizion techniques to render whole societies unable to come to rational decisions even when confronted with the obvious. He joked that they could tell you the sky was Black so often, that even when they showed you it was really Blue, you wouldn't believe it.

Someone mentioned hearing loss. This is an issue I have noticed, but not from RF but from high frequency noise. Many people didn't like CDs because they didn't sound right, and Solid State amplifiers when transitioning from Tube types. Now with some DSP implementations. I noticed this right away with a certain radio that didn't sound bad but was completely irritating and fatiguing to listen to for more than a few minutes until I started using an external speaker with a tailored response. Subsequent to that episode I experienced an overnight hearing loss in one ear of all frequencies over about 1500 Hz in that ear along with a peak at that frequency that is quite tender. It is a known fact that CW ops who use headphones are more prone to hearing loss, so I would really like to see more research and solutions

there.

> don't recall the rest of the story.

This would all depend on the type of Radar, and it's specific
Transmitting Characteristics. Some military radars of that era
were in the Megawatt Peak Pulse Power range, and these "could" have
Biological Issues in the near field. Very few radars of that era,
were CW, Frequency Agile, or Spread Spectrum Radars, with High Power
CW outputs.

Much more likely, would be the Antenna, smacked the guy, physically,
and, or knocked him off the ladder, he may have been standing on,
when it started turning, unexpectedly.... This type of injury is
still very common, even on commercial Marine and Aircraft Search Radars,
that don't have the Peak Pulse Power Levels, even at the Antenna Radiator
Surface, to cause Biological Heating Issues.

The correlation is 1.

There are radio waves and there is cancer.

Correlation does not imply causality.

The ONLY effect that radio frequencies can do to humans is thermal.
You have to increase the frequencies to the upper visible region
(blue since we are talking frequency rather than wavelength) before
there is any ionizing radiation. Note, however, that thermal effects
can be damaging.

I have two books on industrial applications of microwaves that describe where the early Litton devices were first used in restaurants (but the books are in Tennessee and I am in SC so I cannot provide references). It was found that at many restaurants, the doors were taken off the units and the ovens were operated continuously. Litton soon provided interlocks on the doors! People would place food into the cavity without turning off the microwaves. Other than a few thermal burns, no one was seriously hurt by the ovens – with one exception. In fact, I would be quite willing to place a hand into an operating home microwave oven for several seconds at a time. With reasonable blood flow, the thermal energy is quickly spread out to the rest of the body. But the exception is quite serious. The cornea and lens of the eye have essentially no blood flow, so any heat generated there builds up. This can produce cataracts. The effect was seen among many early experimenters with microwaves and many members of the military. working with high power radars. So while the new weapon Richard talks about is non-lethal, it can easily cause blindness. This may be why the military is not so interested.

I have seen demonstrations of one of these devices on one or another cable channel. I believe they mentioned a frequency in the 60GHz range. They also mentioned the penetration depth on skin was something like a mm. The effect is supposed to feel like instant extremely severe sunburn. You WILL leave the area immediately. They tested it on one of the hosts of the show. He moved out of the area of the effect very quickly.

Given the desire of the subjects to get the hell out of Dodge when the system was pointed at them, I doubt cataracts would be an issue.

Don't take any numbers I stated here as correct, it was a while ago.

Tom,

I have seen the video too. But 1 millimeter penetration depth is still
enough to do serious damage to the eye. I doubt if this weapon ever
makes it into production. Is anyone familiar with the Hague Conventions
in relation to this?

Well, not exactly. Pulsed RF can be "heard". The original 1962
article:
<http://www.raven1.net/frey.htm>
Military applications:
<http://www.newscientist.com/article/dn14250-microwave-ray-gun-controls-crowds-with-noise.
html>

There's also some research into resonant vibrational effects of the
modulation frequency (i.e. GSM 217Hz buzz) on various cellular
structures. I don't recall the results (and am too lazy to find
them). Light reading:

Biological Effects Research:
<http://www.bioelectromagnetics.org/pubs.php>
<http://www.bioelectromagnetics.org/resources.php>

The FCC position:
<http://www.fcc.gov/oet/rfsafety/>
<http://www.fcc.gov/oet/info/documents/bulletins/#56>
<http://www.fcc.gov/oet/info/documents/bulletins/#56>

Handbook of Biological Effects of Electromagnetic Fields:
<http://books.google.com/books?id=PZd_2UJrwdwC>

Google searches for papers on the topic.
<http://scholar.google.com/scholar?q=radio+frequency+biological+effects>
<http://scholar.google.com/scholar?q=biological+effects+of+electromagnetic+fields>

Suggestions for furthur research:
1. Why does expsosure to RF seem to cause a compulsion for beginning
hams to upgrade their licenses?
2. Does the presence of RF cause cell phone users to yell into the
handset, while non-RF POTS phone users show now such tendencies?

That's because all their tuners have the same component values (L and
C) in the same basic tuner configuration (switched L). The various
models just have different power ratings (and I suppose the loss is
different) and different other features.

It's a fairly straightforward process (albeit tedious) to map out all
possible places on the smith chart that can be tuned to 50 ohms by
their tuners. Somewhere around I have some plots I did with matlab
for just that.

Basically, you can get close by knowing the minimum and maximum L and
C available. The step size (which is fairly even across the range...
they have L and C in the 1,2,4,8 sequence) determines how close you
can get to 50 ohms from some arbitrary load Z (assuming it's in

range).

The power limitations on a tuner are sort of complex (which is why you don't see a lot of detail). There's the current through the L and C, and the voltage on the C. There's no simple relationship between, say, vswr and component voltage/current, since it depends on the particular match configuration. What you can assume is that the potential rise is proportional to the Q of the antenna and tuner together. Since antenna Q is usually fairly low compared to tuner components, you could probably get close by taking the ratio of the antenna's reactive component to the resistive component. (short verticals, notorious for high voltages in a tuning network, have high reactance and small resistance..)

Impedance is the product of inductive and capacitive reactance in a AC
circuit

Resistance is the load in a DC circuit.

I think impedance has a different affect at different frequencies.....

Please correct me if I got all my theory wrong.

Simply put, impedance is frequency dependent, resistance is not.
Thats why it is hard to specify a resistance or impedance range for a
tuner. Our antennas are frequency dependent because a 50 ohm match
is required no matter what frequency we transmit.

3272. Piano Wire Antenna for Experimental Rocket

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-23 23:40:22 UTC
From: mr1956 <mr1956@comcast.net>
Message-ID: <943a9bbd-214b-43b2-ac31-14f1d1c03091@f19g2000yqo.googlegroups.com>
Source record: 15396

I am looking for some help developing a properly tuned piano wire antenna for an all metal experimental rocket.
This particular vehicle currently uses a Digi International 9Xtream 100 mw transmitter which operates using Frequency Hopping Spread Spectrum from 910 to 918 MHz.

The first flight used a .062" diameter length of piano wire cut so that the exposed length was about 1/2 wavelength. The wire antenna was isolated from the metal airfame with a small nylon penetrator and connected to the transmitter via about a 12" length of RG-178 coax. The coax was terminated at the antenna via two small jumpers (soldered to the center conductor and shield). The shield was grounded on the metal airframe transforming the entire rocket into an artificial ground plane (the antenna was also swept back at about a 45 degree angle to reduce drag.

During this first flight we observed a range of about 10 miles, about half of the published range of this transmitter. The RF system is used as a downlink for GPS data and we did not get a good radio link after ignition until the rocket had descended to about 50,000 feet. Maximum velocity was about Mach 3 which is why a conventional antenna cannot be used as it will be melted by friction.

For the second version, we are thinking of using a slightly smaller diameter piano wire for a 1/4 wave length antenna as I think this may be more suitable for a system using an artificial ground plane. In addition, I plan to terminate the RG-178 coax directly at the antenna and seal it with potting compound. This new antenna will be mounted totally on the exterior of the airframe and angled back only about 10 degrees to give a better radiation pattern.

However, I would really like to properly tune this new antenna and was wondering if anyone in this group has any ideas as to how to do this. Doing a tuned RCL circuit at this frequency is proving to be difficult using discrete components, to say the least. I do not have an SWR, but do have an RF millivolt meter as well as the means to measure the capacitance between the antenna and metal airframe.

Any help will be appreciated as I would hate to fly this thing again and not get it back because our RF downlink had insufficient range.

At Mach 3, I seriously doubt you could hold it as erect (80 degrees to
the fuselage) as you might try with smaller wire (in fact, I would say
it would be plastered down).

If your telemetry is directly below its ascendance, you might try a
full-wave or longer antenna trailing below (if it can withstand the
propulsion heat). If that is not possible, look into an inverted F:
http://www.qsl.net/kb7qhc/antenna/Inverted%20F/index.htm
(it doesn't have to be a thick antenna).

Hi C

Have you considered flush antennas, like slots?

Is is practical to use antenna directivity at the ground station to increase the "range"?

It might be advantageous to use Linear Polarization on the rocket and Circular Polarization on the ground.

For impedance measurement at L band, it is possible to build a slotted line using plumbing supplies. That presumes that you already have access to a signal generator and a detector to record the signal generator's output.
A home built slotted line will have difficulty regestaring low VSWRs.
But, once it is known that the load impedance is close to the line impedance (low VSWR), a directional coupler can be used to match more precisely.

I have built a "plumber's delight" slotted line that works well at 130 MHZ. The high quality directional couplers are affordable on eBay.
Note - If I can do it, it cant be too complicated!

Ummm... let's do some path loss calcs first. I'll assume that you're
using a matching XStream radio on the ground, with a moderate size
yagi antenna pointed in the general direction of the sky.

Rocket end:
xmitter +20dBm
tx coax loss 0dB
tx ant gain 0dBi (monopole 1/4 wave)
path loss (to be calculated)
rx ant gain +12dBi
rx coax loss 0db
rx sens -110dBm (at 9600 baud)
I'll assume a minimum fade margin of 20dB.

Adding up all the gains, losses, fade margin, and guesswork, I end up
with a maximum path loss of 132dB. Plugging into a handy online
calculator at:
<http://www.terabeam.com/support/calculations/free-space-loss.php>
I get a maximum range of 25 miles. It should work.

However, the weak link here is that I'm doing quite a bit of
guesswork. For example, you really do need a +12dBi (tracking?) yagi
antenna to make this work. If you use a simple dipole, with a gain of
perhaps 2dBi in place of the yagi, your maximum path loss just dropped
to 122dB which yields a maximum range of only 8 miles, which is

roughly what you're getting.

You may also be getting a major interference at altitude, which does not appear on the ground. From 5 miles up, the rocket is going to hear plenty of 900MHz interference from all over the country. Each signal will be fairly low level due to the distance, but there will be lots and lots of signals up there. Try your rocket radio from a local mountain top before launching to see if the receiver can handle the interference. Since it's a frequency hopper and not a direct sequence spread spectrum radio, it probably will, but it doesn't hurt to test.

Incidentally, the previous back of the envelope path calcs are the BEST case model. There are always additional losses and reductions. For example, few manufacturers seem to meet their published specifications. The antenna gains really require a full NEC2 simulation which includes the metal rocket body. Things only get worse.

>For the second version, we are thinking of using a slightly smaller

You're reinventing the wheel. Look at photos of the original Explorer I satellite (with Von Braun and others holding it over their heads). There are 4 wires radiating from the tubular rocket casing forming a circularly polarized double dipole "turnstile" antenna. Since it's since one antenna is always visible, there's no blocking by the missile body. Since it's circularly polarized, there's no positional nulls and peaks.
<http://history.nasa.gov/sputnik/expinfo.html>

>However, I would really like to properly tune this new antenna and was
>wondering if anyone in this group has any ideas as to how to do this.

Cut it for 1/4 wavelength at about 921MHz. Be careful when cutting the coax phasing sections to get the velocity factor calcs correct.

>Doing a tuned RCL circuit at this frequency is proving to be difficult
>using discrete components, to say the least. I do not have an SWR, but

>capacitance between the antenna and metal airframe.

900MHz VSWR meters that work at 100mw are not common. You would have problems using one anyway because the xmitter does not generate a CW signal suitable for easy testing. Methinks you'll do better dragging the rocket somewhere that has a network analyzer or suitable pile of test equipment for characterizing the antenna.

>Any help will be appreciated as I would hate to fly this thing again
>and not get it back because our RF downlink had insufficient range.
>
>C. Newport

I think you'll find that the tracking 900MHz yagi antenna on the
ground is the key part of the puzzle. Did you try driving the rocket
5 to 10 miles away and testing if it can be heard from the ground
station? If you run this test, it's easiest to run between mountain
tops to insure line of sight.

Good luck.

Slot antennas have the maximum lobe perpendicular to the rocket axis.
There's very little signal below the rocket. This is why tracking
stations are far away from the launch site. If the rocket were
overhead, and going straight up, there's no signal.

Slot antennas are also a power waste. You need 4 slots, run by a
power splitter, in order to insure that at least one antenna is
oriented in the direction of the receiver. Meanwhile, the other 3
slot antennas are radiating power to nobody in particular. Say goodby
to about 3/4th of your tx power. Receive sensitivity is not
affected.

>C. Newport

Better length is about lamda/4 or lamda 5/8.
Lamda/2 is way off.

Do not use too thin wires, the thicker the better.

For reception on the ground station use a helix antenna,
because that antenna is polarization independent.
The antenna must be pointed in the direction of the object,
helixes are very directional.

http://hamwaves.com/antennas/inductance/helical_antenna.jpg
http://www.rac.ca/tca/2006-01%20Helix%20Design%20Calculator.html
http://jcoppens.com/ant/helix/calc.en.php

If direction is a problem,
use a quadrifilar as ground station antenna.

I installed a 10-foot TVRO at home in 1985 and read an inordinate amount of material on the subject in the 1980's. I read a "don't let this happen to you" story about an experimenter who supposedly used a microwave oven magnetron as a local oscillator for his own TVRO. He didn't shield it properly and received fatal heating injuries to his internal organs.

Possibly BS, possibly accurate. I tried finding some reference to it on the Internet but was unsuccessful. Anybody remember the story?

The LO for a C-band TVRO is 5150 MHz, nowhere near a Microwave oven freq (2450) but its second harmonic, 4900, is a candidate for block downconversion of some of the channels.

DIGITAL CAMERAS, CAMCORDERS

Sunday – Monday Only: Free Joby Gorillapod Tripod with Select Digital
Cameras. Valid 5/24-5/25

IPOD & MP3 PLAYERS

Sunday – Monday Only: Free $25 Gift Card with Zune 120GB MP3 Player.
Valid 5/24-5/25
Sunday – Monday Only: $20 Off Sony AM/FM Clock Radio with AppleR iPodR
Dock, Plus Free Shipping. Valid 5/24-5/25
Sunday – Monday Only: Free Shipping on All AppleR iPodR MP3 Player
Cases. Valid 5/24-5/25

GPS AND CAR ACCESSORIES
Sunday – Monday Only: $20 Off Sirius Stratus 5 Dock & Play Radio with
Complete Vehicle Kit2. Valid 5/24-5/25
Sunday – Monday Only: $50 Off TomTom XL 330S Portable GPS Receiver
Package, Plus Free Shipping, Now 179.99. Valid 5/24-5/25

Sunday – Monday Only: 10% Off All Car Video Players. Valid 5/24-5/25
Sunday – Monday Only: All Cobra Radar Detectors On Sale. Valid 5/24-5/25

HOME THEATER

Sunday – Monday Only: Free Select Blu-ray Disc Movie with Any Blu-ray Disc Player. Valid 5/24-5/25
Sunday – Monday Only: 10% Off Select Geek SquadR Home Theater Installation Services. Valid 5/24-5/25
Sunday – Monday Only: Get a Select Sony Blu-ray Disc Player for $99 With Select Sony HDTVs. Valid 5/24-5/25
Sunday – Monday Only: 15% - 20% Off Select Speakers. Valid 5/24-5/25
Sunday – Monday Only: Free Select Blu-ray Disc Movie (Shipping Extra) with Any Blu-ray Disc Player. Valid 5/24-5/25

MUSICAL INSTRUMENTS

Sunday – Monday Only: All Guitar Straps, Picks, Strings and T-Shirts On Sale, Plus Free Shipping. Valid 5/24-5/25

APPLIANCES

Sunday – Monday Only: 15% Off Select Small Appliances & Personal Care Products $29 and Up. Valid 5/24-5/25
Sunday – Monday Only: 15% Off Select Major Appliances and Countertop Microwaves. Valid 5/24-5/25
Sunday – Monday Only: 10% Off Select LG Major Appliances and LG Countertop Microwaves. Valid 5/24-5/25
Sunday – Monday Only: All Compact Refrigerators On Sale. Valid 5/24-5/25
Sunday – Monday Only: 10% Off All Air Conditioners and Fans. Valid 5/24-5/25

Hi Jeff

Why are you so negative?? I have designed and built lots of slot
antennas that were widely used on military aircraft. The efficiency is
quite good. I am sure a smart guy like you could design a slot antenna and
locate it for those guys with the 3G rocket. There hasnt been any text
that restricts where the slot could be located. As I read the original
post, they werent receiving signal from the accending rocket. Maybe they
only want to receive data that was recorded after the rocket reached it's
peak. There are lots of information that you and I dont yet know. But,
my major question for you is "Why are you so negative?".

Hi Helmut

It may be that you are not familiar with a ground based antenna with similar caracteristics to a QHA, but muich easier to build at home. The DCA is much less critical to make work properly than a QHA.

So you designed for a half wave antenna fed with 12" of RG178.

Lets suppose for a moment that the antenna has a feedpoint Z of say, 2000 +j0 ohms. The line will transform that to 5+j14 at the tx end, and with a loss of 4.8dB (ie 33% efficiency). The tx is unlikely to develop is rated output power into such a load, so there will be some further reduction.

Yes, an antenna of half the size (ie a quarter wave fed against the metal rocket body) might well work ten times as good.

Owen

Yes the antenna will be pressed back against the airframe during
flight but should be erect at apogee and during descent. The previous
one survived just fine.

I have looked at slotted or flush wrap around antennas but integrating
one into the existing design would be difficult due to the wall
thickness of the metal. Something like that would have to be mounted
flush and I would be worried about the wind blast peeling the thing
off. Certainly, there is much that can be done but I am unfortunately
not Wallops Island and have limited resources like anyone else.

I have been reading the ARRL antenna book and while there is much
information, a lot of it is over my head. But one point I think a
chapter makes is that a 1/4 wave monopole will work better than a 1/2
wave using an artificial ground plane because of the way the voltage
peaks at the end of the antenna; or that is how it seems.

I have looked at slotted or flush wrap around antennas but integrating
one into the existing design would be difficult due to the wall
thickness of the metal. Something like that would have to be mounted
flush and I would be worried about the wind blast peeling the thing
off. Certainly, there is much that can be done but I am unfortunately
not Wallops Island and have limited resources like anyone else.

Hi C

It looks like your "wire" antenna might actually be OK for your project.
You have demonstrated that it works when the rocket is nearly 10 miles away
when you hoped for 20 miles. Evidently, the antenna doesnt need to
function while the rocket is accending.
Are you able to improve the ground based antenna The equipment you now
have would need only 6 dB improvement to provide the 20 mile range.
I'd like to know more about your ground based antenna system.

Jerry KD6JDJ (who has lots of small
diameterTeflon dielectric coax to donate to a real project)

>I have been reading the ARRL antenna book and while there is much
information, a lot of it is over my head. But one point I think a
chapter makes is that a 1/4 wave monopole will work better than a 1/2
wave using an artificial ground plane because of the way the voltage
peaks at the end of the antenna; or that is how it seems.

You are right. Antenna radiate from the end. So it should be thick as
possible.
How the length should be I do not know.
See: http://www.arrl.org/news/features/2007/09/28/03/?nc=1
"

The antennas are described as matched pairs, one 2.4 meters and the other 2.9 meters in length. The available literature gives no information on the electrical characteristics of the antenna system but it is probably safe to assume that they were some variation of a center-fed dipole with the longer pair radiating the 20 MHz (14 meter) signal and the shorter pair set up for 40 MHz or 7.5 meters. Figure 6 shows technicians attaching two of these elements to their angled connectors during assembly. Based on our assumption about the antenna configuration, we can use modern modeling software to analyze a dipole with of 5.8 meters in total length, angled to 70 degrees at the center where it is fed by a single 20 MHz source."

Is possible to determine the length of the antennas in wave fractions?

Jerry:

The "ground station" is not much; just a small receiver with a standard 1/2 wave dipole attached using an sma connector. The receiver is battery powered and connected to a laptop using a standard serial cable. We had thought about using a Yagi during the previous flight but it just got left by the wayside with everything else that had to be done.

The basic telemetry and downlink system is manufactured by Ozark Aerospace (Erik Hall) but uses a Digi Int. 9Xstream radio modem (www.ozarkaerospace.com and I use the ARTS TX-900G and RX-900). I actually built my own transmitter and GPS system using a 5 watt data radio and Garmin GPS with a small Li-Ion battery pack. But that system was "lost" during a not so successful flight in Texas a few years ago. Hence, for this design I opted to buy something off the shelf that already worked.

Most people using this system have fiberglass airframes so for them it is a simple matter to use a commercially available antenna mounted inside of the airfame. But this is an all metal design so I had the telemetry board made so I could connect my own antenna. FYI, the rocket is 15 feet long, 6" in diameter and weighs over 100 lbs empty and close to 200 lbs. on the pad. It is all aluminum, except for the nose cone which is laminated birch. I'm using metal for the airframe because it just easier to work with and the first 8 feet of the rocket is metal anyway as that is the motor case.

The published range for this Digi Int. transmitter is 20 miles, though people doing amateur high-altitude balloon flights have reportedly observed even better reception from high altitudes (i.e., over 80 K feet). This rocket did about 85,000 feet last September at Black Rock, Nevada so it is doubtful that we will get GPS data at apogee anyway due to the COTS limitations. But I'd like to get as much as possible and will probably eventually convert to the 9Xtend modem which goes up to one watt xmit power.

That was my first thought on side mounted antennas.

The best solution would be something on the fins if that were
possible with the airframe design.

The published range for this Digi Int. transmitter is 20 miles, though people doing amateur high-altitude balloon flights have reportedly observed even better reception from high altitudes (i.e., over 80 K feet). This rocket did about 85,000 feet last September at Black Rock,

Nevada so it is doubtful that we will get GPS data at apogee anyway
due to the COTS limitations. But I'd like to get as much as possible
and will probably eventually convert to the 9Xtend modem which goes up
to one watt xmit power.

Curt

Hi Curt

I strongly suspect that you can use the antenna you now have on the
rocket. There is a possibility that you hadnt optimized the pointing of the
stub on the base station. You might be able to get enough system gain by
using a simple Turnstile Antenna at the ground station (Wikipedia).
If you decide you want more signal than you get with a Turnstile, it would
be easy to build a 900 MHz Helix or Crossed Yagii.
It seems very important to use a Circularly Polarized antenna at the
ground station.

Jerry

> Jerry KD6JDJ

I don't think I'm being particularly negative or offensive. I offered
what I consider to be a more reasonable alternative (CP turnstile
antenna) and ran the path loss calculations to insure that it would
work. I also itemized why a slot antenna would be an inferior
solution. My main point is that with a vertically ascending rocket,
the antenna pattern should be primarily ahead and behind the rocket,
not perpendicular.

I've seen one paper design that used insulated fins for the 4
turnstile antenna elements. However, I haven't seen the actual

rocket. I also built a 2.4GHz antenna system for a model airplane for a video downlink. The initial design was a slot antenna system in the fuselage, which worked great when the aircraft was overhead, but did badly when near the horizon and out of the antenna pattern. Two vertical monopoles and a power splitter did much better, especially since it worked well in inverted flight. I must admit that I haven't designed a slot antenna system for a high power Mach 3 rocket. I did build a small "G" motor rocket without telemetry but that doesn't count for much.

Anyway, we're both guessing. Without a clue as to the size, geometry, and construction of the rocket, the configuration of the ground station antenna, the location of the ground station, and the approximate trajectory (probably straight up), we can only speculate as to the optimal design. My guess is that this a level 1 rocket with an "H" or "I" motor which could barely tolerate the slight increase in diameter required for multiple slot antnnas. Wire or fin antennas don't add anything.

I am familiar with the Helix antenna and the Yagi, but not a "crossed yagi." Am I correct in assuming that the crossed yagi is simply two yagis with the reflectors at right angles to each other (so that it looks like a cross when viewed from the end)?

Directionality on the ground station is an issue though. Once the rocket goes out of sight (it was only visible for about three seconds of a nine minute flight), pointing the receiving antenna in the right direction and elevation would be guess work. I know that the yagi must be much more directional than the 1/2 wave dipole used before but how much I do not know. I would imagine it is determined by the number and spacing of the elements. I also think that having the transmitting antenna more perpendicular to the airfame will help during apogee and descent.

I am familiar with the Helix antenna and the Yagi, but not a "crossed
yagi." Am I correct in assuming that the crossed yagi is simply two
yagis with the reflectors at right angles to each other (so that it
looks like a cross when viewed from the end)?

Directionality on the ground station is an issue though. Once the
rocket goes out of sight (it was only visible for about three seconds
of a nine minute flight), pointing the receiving antenna in the right
direction and elevation would be guess work. I know that the yagi must
be much more directional than the 1/2 wave dipole used before but how
much I do not know. I would imagine it is determined by the number and
spacing of the elements. I also think that having the transmitting
antenna more perpendicular to the airfame will help during apogee and
descent.

Curt

Hi Curt

I figured that your current telemetry system is demonstrated to be nearly
good enough. From the info I now have, it seems that you need only 6 db
additional gain to be able to double the distance between the rocket and the
ground station. Since you used linear polarization on both the rocket and
the ground station, it is possible that you will get adequate signal by
making the base station antenna "Circular".
If the rocket accends to 20 miles and the ground station is close to the

place where the rocket started, the apogee point could be 2 miles from "straight up" and still be less than 5.7 degrees from straight up. I'd suggest using a base antenna with a pattern much wider than 11 1/2 degrees so the antenna needs to be pointed up, not aimed.
I'd expect there are other rocket amateurs using simple Turnstile Antennas for their base station antenna.

Jerry:

By "circular" I assume you mean either a helix or crossed yagi so that the receiving angle is uniform around the axis of the antenna?

Your assumptions are pretty close. The launch pad was about 1.25 miles from the ground station (to the north I think) and the rocket landed about 2.5 miles east of the receiving station. If I remember correctly, we got a good link down to about 4,000 feet during the descent on parachute. So if I fabricate or purchase an antenna with a sufficient receiving pattern, point it generally up but maybe slightly towards the pad, it should work. We were lucky that day as the winds aloft were not too bad. In addition, the rocket comes down fast, at about 75 feet/second so as to minimize drift. Everything was built for strength because I knew it would hit pretty hard.

Let em play with some of the online calculators and see if I can come up with a helix design and do some searching for a crossed yagi.

Your transmitter is designed for a particular load impedance, almost
certainly 50 ohms... check the specs.

The load presented to the transmitter terminals depends on the feed point
impedance of the antenna, and impedance transformation that may occur on
the coaxial feedline.

In the case you describe, the *antenna system* design was most unsuited
to a 50 ohm transmitter, hence the considerable loss predicted.

Your newer proposal for a quarter wave wire perpedicular to the rocket
body with the coax shield connected to the metallic rocket body is not
exactly 50 ohms, but probably close enough that antenna system efficiency
will be fairly good and the transmitter should deliver most of its rated
power.

Having read Sevic's book I am building the 4:1 Guanella balun on a SINGLE toroidial core. My question relates to the direction of winding for the two biflar windings that are required. The windings are connected in parallel on the low impedance end and in series on the high impedance end. The text speaks to the need to make connections such that they are series aiding. Do I need to wind one biflar pair in a clockwise direction and the other in a counterclockwise direction to achieve this if I want only parallel connections on one end and series connections on the other? I hope somebody has the book to look at the 4:1 Guanella configuration.

The article at http://www.vk1od.net/balun/gsc/index.htm might help to clarify the terminology, and show you that a 4:1 Guanella balun on a single core will not work properly.

I had posted some links here some months back about the other effects of rf. Seems there is a little more than just heating going on. I have noticed that the heating effect I "feel" on extended cell phone use is not actual heat.

Interestingly, most cell phone fear is based on cancer. It's not hardly likely, for the reasons already outlined.

The biggest danger to cell phone towers is if one falls on you.

I'll not go so far as to say that there are no effects however. I suspect something is happening that we might not know about at this time - and there is some tantalizing evidence showing in some of the research.

Thanks for quick reply Owen. Guess I took the Sevick single toroid
design as authoritative. I will move to a 2 core configuration, which,
in my case, is more intuitive to begin with. Also bookmarked your
page. Good stuff!

Dykes,

Oh well, lots of people have built them and assert that they "work", but
that goes to the meaning of "works" more than anything.

I think there are even commercial single core implementations of
Guanella's 4:1 balun, but then there is a lot of snake oil in that
industry!

If you make one on a medium core and measure it, it is clear that it
doesn't "work" where "work" means that the currents in the output leads
are approximately equal but opposite in direction.

FYI finally got the answer from LDG:

It's polar coordinates (as opposed to rectangular).

For example: 200 -j300 in rectangular would have a magnitude of 360 in
polar.

I think we were the first company to ever publish tuning specs for
autotuners
and I happen to choose polar that day, so that's what everyone else
uses now for
autotuners.

It's just an approximate number, but it gives you a rough idea of what
to
expect. If you find that your long wire (for example) has an impedance
of 2500
ohms (either measured or simulated), you can be pretty sure that our
tuner is
not going to tune it.

So, I deduct 600 Ohms could mean any impedance A+JB where sqrt
(A^2+b^2)=600. ;-) ....

Nope. There are other dangers:
<http://802.11junk.com/jeffl/pics/drivel/monopoleBurn.jpg>
<http://www.bext.com/_CGC/pictures/celltowerfire.jpg>
<http://weepnews.blogspot.com/2009/01/cell-tower-burned-down.html>
No, it's not RF induced heating. It's always the same story. Some
idiot with a welding rig decides to work on the tower and sets fire to
the coax cables inside the tower.

Need some entertainment? Just set fire to some LMR-400 or some CAT5
cable. Burns quickly and quite nicely. Ummm... do it outside.

Dave

I'm not an engineer either but I have installed ridge top communications shelters from the Argentine Pampas to Alaska without having lightning caused down time for the communications equipment that the shelters contained. You need a single point of ground connection in the shack. One of the best ones to have is an antenna entry bulkhead made of some stout aluminum or copper plate. You then run all of the connections that serve your equipment through or past that bulkhead. You also mount

all of your protectors on or at that bulkhead. From the outside of the bulkhead you run a ribbon conductor down to the Grounding Electrode that you install as close to directly below the bulkhead as you can.

If the electrode will be driven rods then buy yourself several rod couplers to permit you to drive the rods to a depth below the permanent moisture level. The driving is best accomplished by renting an electric demolition hammer and a ground rod cup. You will need some means to measure the grounding electrode resistance to earth. You can rent a three pole or four pole ground impedance tester or a much easier to use clamp on ground loop impedance tester. You want the total impedance of the Grounding Electrode System to be less then twenty five ohms and the lower you get it the better off you are. If you drive four or five rods on top of each other then you will have reached between thirty two and fifty feet into the earth. In most cases you will strike hard pan or rock before that depth and thus will have to drive additional rods. If your first stacked rod does not get you down to twenty five ohms or less you just drive a second stacked rod at least the length of the first rod away from the first rod. Once you have the Grounding Electrode down to twenty five ohms or less you bond it to the electrical grounding electrode using a number four or larger copper conductor that is run entirely outside the builidng.

For best protection you would run the bonding conductor in the form of a partial ground ring consisting of a number two copper conductor buried in trench that is thirty inches deep and runs from the one electrode to the other around the outside of the home.

If your home is new enough to have a concrete encased electrode for it's power ground then it may be possible to bond to it by bonding to one end of any steel beam that was used in the floor support at the basement ceiling. If the electrician was competent the beam will be bonded to the concrete encased electrode. You will have to check carefully to assure that it is so bonded.

It is terribly unlikely that your home has a true Ufer ground because constructing one involves a mesh of half inch or larger rebar that is continuous throughout the basement floor and foundation footers with all junctions double tied and one piece of rebar turned up out of the floor at the location of the electrical service equipment.

If your not willing to do all of that; and most hams are not; you will have to choose how much to do. The bulkhead, a one inch braid Grounding Electrode Conductor, two eight foot driven rods at least their own length apart, and the number four bonding conductor to bond those to the electrical service ground is the minimum for lightning protection. Anything less is a feel good waste of time.

What I have been finding out is developing a matching circuit for the
output of the transmitter is not easy, at least for me and at that
frequency. It could be done if I was a cell phone manufacturer. I
think much will be gained by using the 1/4 wave as opposed to the 1/2
wave on the airframe and a yagi or helix antenna on the ground
station.

I will post a link to some images of the project when I have time.
Information on the flight can be found at www.lokiresearch.com and
look for information about the Proteus 6 flight at the Balls 17 event,
Black Rock, NV September 2008.

I'll also add some thoughts about how I intend to proceed based on everyone's great input from this forum. One quick question: Am I correct in assuming that the ground lead of the rocket mounted antenna should be as short as possible? i.e., the connection between the shield of the RG-178 and the metal airframe.

Thanks,

Curt

Unless you published your specs over 20 years ago, Motorola was the
first one to publish Tuning Range Specs, for their Second Generation
Autotuner, back when Bill Shielb was Chief Engineer for the MF/HF SSB
Engineering Group......

Most of the Modern Day Binary Lumped Constant AutoTuners are based on
his work at Motorola, which he brought out west, when he came to
Northern Radio Co., and then finally to Berlonix Corp. The SEA-1600
by SEA, (Stephens Engineering Assoc.) was a reverse engineered AutoTuner
based on Bills work, done my Mark Johnson and Bill Forgey at SEA, but
with a much improved Microprocessor Control algorithm, Phase and Power
Sensors, and spawned a long Series of SEA16xx Autotuners, of which the
SEA1612B was the most recognized, and the SGC Tuners were copies.

Loss on the coax can be much worse when it is mismatched. I gave you
figures for a 2000 ohm load (representing your end fed half wave antenna).

The loss for 0.3m with a 30 ohm load is 0.5dB, it is 90% efficient. If you
shorten it, you will reduce the loss, but I wouldn't obsess over it. The
problem you have right now is due principally to high standing waves on the
line and unsuitable transmitter load, and you solve much of that using a
quarter wave antenna.

Without a diagram, we are at great risk of misunderstanding. If you cannot
affort the time to invest in making a drawing, you take the risk of
misinterpretation of your words. The connection from the shield to the
metal air frame and presumably metal skin should be short. Regard that the
effective length of the antenna in that case is the distance from the
shield to the tip of the whip.

OK, I think I know generally how to proceed from here. FYI, some images of the previous design can be found at the following URLs:
http://i647.photobucket.com/albums/uu199/mr1956_2009/Curtjeff.jpg
http://i647.photobucket.com/albums/uu199/mr1956_2009/liftoff.jpg
http://i647.photobucket.com/albums/uu199/mr1956_2009/Coupler02.jpg
http://i647.photobucket.com/albums/uu199/mr1956_2009/Elec05.jpg
http://i647.photobucket.com/albums/uu199/mr1956_2009/Recovery04small.jpg

This one is an image of the type of gear I normally work with:
http://i647.photobucket.com/albums/uu199/mr1956_2009/Guam02004.jpg

So the key points are as follows:

1. Fabricate a 1/4 wave antenna and mount that is totally exterior to the metal airfame and terminate the coax as close as possible to the antenna.
2. I imagine that I could start off with a longer than needed whip antenna, then trim it back while taking measurements with the RF millivolt meter until it looks like I've gotten maximum signal strength.
3. Use either a helix or yagi receiving antenna on the ground station to boost the signal strength on the receiving end.

I accept that words alone are not always sufficient to describe such things but I think the important issues have been well described by everyone here. I can only make the RG-178 whip connecting the transmitter to the antenna so short, as I need sufficient length to remove the electronics from inside of the avionics compartment to change batteries,etc. But I think the critical issues are having a direct and solid electrical connection between the antenna and coax and using a higher db antenna on the receiving end; the ground based antenna may make the most difference in the end.

I'll have to go back and look at the posts to make sure I've gotten all of the information right and if anyone has any more questions after reviewing the images please let me know and I will respond as needed. Also, there should be an article coming out in Smithsonian Air & Space magazine in the "Above and Beyond" section sometime in the future describing this particular flight and more information is online at www.lokiresearch.com (the Proteus 6 flight).

Reminds me of one Field Day we were doing some SSTV. Fellow on the other end tells me he's going to send me a really "hot picture". A few of the SST pix I've seen aren't quite family friendly, so I tell him to be careful, since we had kids around. He says, "No problem, but th epicture is really hot - I have to warn ya".

Sure enough, the picture he sent was of a Microwave tower burning.

3318. Loop antenna matching question

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-26 19:58:10 UTC
From: Michael Coslo <mjc5@psu.edu>
Message-ID: <gvhhkj$do4m$1@tr22n12.aset.psu.edu>
Source record: 15292

I'm starting up an old project that I never quite finished - my loop antenna.

When I first put it together, I tried a simple loop of coax to couple the radio to the loop. Was never really satisfied with that though.

I'm wanting to try a gamma match, possibly something a little like what Owen Duffy posted a nice version of.

The Gamma match is fairly understandable to me, and I expect it to work well.

What I am wondering about is in the coax loop coupling system, how is the best match obtained? Loop size? orientation? Luck?

Source record: 15293

Last I tried a loop, I used a simple wire loop of about 10 cm diameter
(for a 1 m antenna diameter).

The coax version might save you some noise when receiving, but I never
tried coax myself, I use solid tubes.
For transmitting, coax or not should make no difference.

I do have an antenna tuner for the plain dipol. For the loop, you never
use antenna tuner.

For tuning the loop for transmitting, I find it easy to make the
coupling loop variable in size, and just try smaller/large loops, and
then fix the size when satisfied

Mike, you haven't given much information about the loop (size,
frequency). Is loop balance / symmetry important?

If it was a small loop, I would not be thinking about a gamma match
because of the impedance ratios for just one reason.

Most of your ideas and concepts were of course correct, Cecil. Your conceptual problem was pretty much as I said: that interference causes northbound cars to travel southbound, and southbound cars to travel northbound. It provided you with justification for adding, subtracting, and superposing average power at will. It was related to the belief you adopted about waves causing other waves to do things. You insisted that it had to be so, otherwise energy would not be conserved. Fortunately for the universe, energy was conserved despite your insistence. So it wasn't merely a difference over semantics. That would have been an even greater waste of time.

How do you know the effects were not thermal? The "malaise" some people feel when exposed to strong RF fields is very similar to the effects felt during a mild fever. My statement was based on how radio frequency fields interact with atoms and molecules. How the body "interprets" the molecular heating is an entirely different matter.

To go back to Jeff's references, any nonlinearity can detect amplitude modulation. Nerve firing potentials are quite nonlinear, of course. The cilia in the human ear have mechanical resonances from typically 20 Hz to 20 kHz (unless you listen to rock music or are as old as I am). These same cilia have thermal time constants in the fractional millisecond range too. It seems to me that RF modulated at audio frequencies could easily be "heard" even though the effect might still be caused by heating.

> Interestingly, most cell phone fear is based on cancer. It's not hardly
> likely, for the reasons already outlined.

And the biggest danger from cell phone use is letting it distract someone who is driving a car (or train or subway).

Unfortunately, many of the researchers do not understand radio frequency fields enough to design their experiments properly. Until they do, we will always be stuck with correlation confused with causation.

> ... it wasn't merely a difference over semantics.

I have not changed any of my basic ideas or concepts.
All I have changed is the definitions of "interference"
and "reflection" that I was using. It was a trivial
problem and easily fixed by changing "causes" to
"corresponds to" and "reflected" to "redistributed". The
only problem left is your refusal to accept my apology
and lay the distant past to rest after I made all the
revisions that you suggested.

You absolute refusal to define any of the words you were
using was part of the problem.

> It provided you with justification for adding, subtracting,
> and superposing average power at will.

For your information, the use of the irradiance (power density)
equation from Born and Wolf is *NOT* superposition of powers.
It is, however, the proper way to add power densities when
interference is present. If the forward and reflected waves are
not 90 degrees out of phase, interference is present at every
impedance discontinuity and energy is being redistributed in
different directions. I would expect a physics major to know
such or at least know where to look to alleviate his ignorance.

You once said that the irradiance equation that I quoted from
"Optics" by Hecht did not appear in Born and Wolf and that
Hecht had been discredited or some such. I bought the Born and
Wolf book and found the exact equation to which you were objecting.

Draw your attention to this: Increase sperm count naturally -
http://mens-health.com.cn/spermamax/
We've got all the best you need to gain popularity.

There are many people who use mobility scooters and electric power wheelchairs to increase, or as their chief source of, mobility. Mobility scooters and electric power wheelchairs are similar in the service that they provide. They also have many other similarities, including the use of batteries. In times passed gasoline was the most common form of fuel for most personal movement devices. Increase sperm count naturally The use of gasoline, however, is not practical for indoor use and has several other issues that can be unsafe. Due to advances in technology, batteries now have a longer per charge life and take less time to charge. Keeping your batteries in good working order is imperative to ensuring your mobility movement device will always provide reliable service. It is important to periodically check battery connections on your mobility scooter or power chair. Increase sperm count naturally Check to make sure that they are tight and are not corroded. Corrosion is a whitish colored sand like substance that appears to вЂ□growвЂ™ on batteries. Both loose connections and corrosion can result in poor performance and should be fixed immediately. You can clean corrosion with a combination of baking soda and water. Make a thick paste by combining the two and apply it to the corroded area. Apply the paste and let it stand for at least five minutes before scrubbing it with a toothbrush. Increase sperm count naturally As a preventative measure you can apply a thin layer of petroleum jelly to the outside of the connections. Corrosion is formed when the metal contacts air and the petroleum jelly will help block the air. You will generally need to change your batteries at some point throughout the life of your personal mobility device. This generally is not very expensive and by properly maintaining your battery you will help increase its life.

Your wife is sure to admire you: http://mens-health.com.cn/spermamax/

It's Octagonal, .75 inch copper tubing, around 8 feet in diameter. It's designed to just reach into the 80 meter voice segment with it's capacitor setup. Upper end is either 17 or 15 meters. It's been a few years since I worked on this, which is the reason for the "around" remarks.

Capacitor is a 4 tube trombone capacitor, each tube roughly a foot in length. External tube is .75 inch, and internal tube is .5 inch. Insulation is wrapped Kevlar sheet around internal tube.

Adjustment is via a power screwdriver and a threaded rod setup to move the trombones in and out.

A crazy person believes that everyone else is crazy. I googled
and couldn't find exactly what I was looking for but here are
a couple of your quotes that I did find:

Jim Kelley wrote:
> Aug 26, 2003, "Again, Born and Wolf disagree with Hecht."

On exactly what subjects do Born and Wolf disagree with Hecht?
After I obtained a copy of Born and Wolf, I discovered that
your above statement, repeated more than once, was false.

> Aug 28, 2003, "Hecht must be far too old and out of date."

Exactly what sections of "Optics" by Hecht is "too old and
out of date"?

If I spent more time, I could find many other quotes of
yours like the above.

Google is a bitch, huh?

> this time - and there is some tantalizing evidence showing in some
> of the research.

Unfortunately, many of the researchers do not understand radio frequency fields enough to design their experiments properly. Until they do, we will always be stuck with correlation confused with causation.

One of the better examples of this was explained by a Japanese professor who taught my first statistics course. He said that the average height of Japanese males dropped several inches in the years following WWII. This could easily be correlated with the dropping of two atomic bombs on Japan. But the real cause was the fact that the Japanese army had drafted the taller men first, and many of these taller men were killed in combat.

Another problem is that in working with human populations, a correlation coefficient of 0.2 is often considered good. But in the physical sciences, good correlation is usually over 0.9 and excellent correlation is usually over 0.99. When working with such research as cancer studies, extremely large populations must be used for their results to be meaningful.

I decided to install a 2m FM rig in my garage to stay in touch with the local repeaters while working on the car. I want a quick and dirty homebrew antenna at the roof line. I know the J-pole is a popular 2m antenna, but why??? The J-pole is basically a half wave antenna fed at the end, right? At 2m you are only 19 inches away from the 50 ohm feed point (a classic dipole), so why not just loop the coax into the middle and forget the matching stub? Am I missing something?

If I do this, would a clip on ferrite at the feed point make a good choke-balun?

The coax must depart perpendicular from the 75 ohm feed point by .2 to .5
wavelength or greater for the Vertical dipole you describe. This makes it a
great tower side mount antenna with gain like a 2 element beam. When
mounted this way, the coax gets dressed down the tower leg and all is well
without ferrites.

J-pole is simple to build with 300 ohm TV twinnlead that was once cheap and
available anywhere. Also the J-pole includes a matching section to 50 ohms
. Hang up one by a string, and roll it up for travel. Light weight and
slick. Vertical dipole needs something like a gamma match to get to 50
ohms, but 75 ohms isn't far off and the antenna is fairly broad too. A
variation is the coaxial dipole, that feeds the coax up a 1/2 wave mounting
pipe to the feedpoint and a 1/4 wave whip and larger 1/4 wave ground skirt.

There's not much performance difference between a J-pole, vertical dipole, and a quarter-wave ground-plane vertical for working "local" repeaters.

A J-pole for outdoor use can be easy to build, easy to mount, and very rugged. For indoor use, you might want to settle for a simple twin-lead J-pole, which is even easier to build and can be easy to mount.

A vertical dipole will tend to have a screwy radiation pattern if you just run the coax up from below and connect to the middle. But probably not enough for you to care.

I'd go with whatever seems easiest to make and easiest to mount in your particular situation.

Not at all. But drawing such a conclusion does reveal that you apparently still have misconceptions consistent with the 4th mechanism of reflection you introduced to us. Your vehement protestations and testimonials about retractions and apologies notwithstanding.

> Can you spell R-E-D-I-S-T-R-I-B-U-T-I-O-N?

Well if not, I'm sure my spell checker can. But you're demonstrated that you can, and we're all very proud of you. :-)

I gave you the dates of your postings, Jim. Here are
another two of your ridiculous statements:

> Jun 18, 2003, "Your idea about a reversal in the direction
> of the flow of energy being caused by something other than
> reflection is nonsense."

Can you spell R-E-D-I-S-T-R-I-B-U-T-I-O-N?

micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveinteractions/index.html

If the redistribution occurs within a transmission line,
it becomes a reversal of direction of energy flow since
there are only two directions available. At the Z0-match
point in an otherwise mismatched system, the reflected
wave energy from the load is redistributed back toward
the load at the Z0-match point.

> Jun 20, 2003, "The waves continue to propagate, 180
> degrees out of phase, transferring no energy.

Exactly how do you prove they continue to exist? If you
measure them, you prove that they contain energy and
thus prove yourself wrong. If you measure zero energy,
you cannot prove they exist plus they do not even
meet the definition of "wave". What happens if those
waves, which are transferring no energy, encounter
a resistive load?

Can you spell M-E-T-A-P-H-Y-S-I-C-S?

The temperature increased was sensed, not an actual rise in
temperature. This was confirmed as the one ear and surrounding area
"feeling warm", yet not warm to the touch. To the touch, it felt similar
to the other ear.

Sure, there might be many reasons for an observed effect. I don't
attribute what I have seen to anything particular, and make no
predictions. Even my thesis that cell phone use makes people stupid is a
joke - mostly. I have seen monumentally idiotic things done by people
while using cell phones. Of course, they might have just been really
dumb to begin with.

Jim Kelley wrote:
> But drawing such a conclusion does reveal that you
> apparently still have misconceptions consistent with the 4th mechanism
> of reflection you introduced to us.

As you know, years ago I changed the "4th mechanism
of reflection" to the "redistribution" described on
the FSU web page and apologized for my poor choice
of words. You are still kicking the dog after he
stopped wetting the floor years ago.

You asked for the mechanism that causes reversal of
the direction of energy flow during wave cancellation
and I provided it. Here it is again:

micro.magnet.fsu.edu/primer/java/scienceopticsu/interference/waveinteractions/index.html

Previously I was using the definition of "reflection",
common to amateur radio, as any reversal in the
direction of energy flow in a transmission line. I
then realized that a "reflection" only applies to a
single wave, not to two interacting waves. I apologized
and revised my article.

Please drag yourself into the present. Some of your
past assertions were/are false. I can dig up many
more if you desire.

Ho Bib

I have used the ferrite clip-on beads for 2 meter antennas. They work
well for me. You will be able to test them by assembling your simple
antenna and see how warm they get after transmitting.
Keep the coax perpendicular to the dipole, dont "loop" it back parallel to
the dipole.

Hi Bob,

Mostly because it serves vanity more than needed gain. If a lossy
rubber ducky can hit a repeater with full quietening, a J-pole has no
claim for need.

What 'vanity' does a J-pole serve? It's a simple, efficient, endfed
halfwave (essentially a 'Zepp'), low angle radiation, easy to construct,
tune up, and mount on the top of a pole. I see no 'vanity'.

If I recall, a full wave loop has an impedence of about 100 ohms, so if you feed it with an electrical half-wave length of 75-ohm coax, you should have an acceptable match, and a decent vswr.

Mike, the symmetry issue is about whether you want the deepest nulls. A gamma match is not likely to give you the best symmetry and hence the deepest nulls.

You are talking about a smallish loop, and without modelling it, I wonder if the gamma feed is as efficient say, as a inner feed loop.

You have gone to a lot of trouble to keep losses in the loop down, it would be a pity to compromise it too much with the feed system.

Owen

More efficient than a rubber ducky was allowed (the need for that
efficiency has been skirted, however), so the claim of efficiency
appeals to vanity when the difference was already noted. More
efficient than a rubber ducky giving full quietening? What does that
matter if not to suit vanity?

>endfed
>halfwave (essentially a 'Zepp')

Now there's vanity in its full glory with the trappings of provenance
(the hushed heritage of the era of the romantic Zeppelins). I bet
tagging it with the name Zepp adds 5dBd gain alone!

>, low angle radiation,

Any lower angle than a rubber ducky? It is vanity to sneer at the
ducky, especially when it gets the job done without all this pomp and
circumstance.

>easy to construct,

I presume this the vain form of "simple."

>tune up, and mount on the top of a pole.

You can mount a rubber ducky on the top of a pole too, but suffer the
humiliation. No vanity boost in doing that, of course; so guilt
demands a J-pole.

>I see no 'vanity'.

I can't either - not here in the basement where I can hit my buddy's
repeater a dozen miles away with a 1/2W HT driving a 6" whip. Note I
say that I "can," but I don't for the shame of not having a J-pole
mounted on a 20 foot mast. I only kerchunk it knowing full well my
buddies won't talk to me on my whip through their own J-Poles. Of
course this is ironic where the repeater is using a quarterwave
because it is:
1. Much simpler,

2. Vastly more efficient;
3. Has an immensely lower angle of radiation;
4. Is superior to tune up;
5. and is mounted on a really, really tall tower (not a pole).

Hi all,

I have tried the Slim Jim antenna on the 2m. I used a 1/4" copper tube, antenna is very good. Then I made another one using 300 Ohm TV clear twin lead, but SWR is very high and it seems to be not adjustable to the same 1:1 of the first antenna. Why? Does anyone know where is the problem? Could be the clear cable plastic not good for the application?

I have looked for black ladder twin lead, but I found it only online in very long reels and with expensive shipping charges for Roma, Italy.

Thx

I started at the same distance of the copper tube antenna. About 1cm
apart SWR seemed to be about the same: not better, not worse. It seemed to
be the best... I've had no time in the week for other tests; I'll continue
today or tomorrow. If someone has an idea it will be appreciated.

Oh dear, this sounds like another case of some poor innocent beaten with a J-Pole when they were a child, leaving a lifelong hatred of the infernal things.

I too was a victim of J-poling, those of us who are identified by the strange double welts and scars, one large and one small. With years of therapy, I can now stand to be in the same neighborhood with the evil "Devil's Cane".

Ever notice that they resemble the dreaded Wouff Hong? The elders were on to something.

Seriously though, they are just another antenna, and usually used for a pretty simple purpose, that of hitting the local repeater. I've used quarter wave, dipole and J-Pole, and yup, they hit the repeater. No majick, just something to mess with.

Right now I am using a J-pole for a more important reason. My wife likes the look better than a ground plane.

The 1/4 wave ground plane has a useless pattern. Main lobe at about 30 degrees above horizon, but broad enough to be usable and simple to build. I have one as a receive antenna for duplex operation, shielded from the transmit antennas by an air conditioner and vertical separation, feeding several receivers with cavities. It is literally thrown on the roof and coax is routed through the ductwork. Hasn't moved for 12 years. Hint: if you use an SO-239, seal the center conductor so water wont run down the rod and into the connector. Tape the coax connector tightly.

For frequencies below 220, it is best to put up an outside antenna. Above those frequencies, RF gets out with much less shielding from the building.

J-poles, vertical dipoles have a more useful pattern below horizon. They provide useful performance without being too large. The typical 2 meter rubber ducky has anywhere from 6 to 20 db of loss. The typical 2m 5/8 and 5db 440 dual band mobile antenna will be noticeably better.

What's with all the EMO girl chatter?

The question is, "Do you use a quarterwave of 75 ohm cable to get
something like a 50 ohm impedance at the TX end - even if this means
using more coax than you really need or, to minimise losses, do you
simply use the shortest length of coax - either 50 or 75 ohm?"

Different diameters of conductors, different dielectric relationships,
that is why. This leads to different dimensions for the same
resonance. Larger conductors resonate at lower frequencies (or at
shorter lengths for same frequency). More dielectic also shortens
resonant length. Just how much, is for you to discover through
experimentation.

I'm following you here, Owen. I'll put together an inner feed loop and
give that a shot. I was looking at the magloop thread you were in on
eHam from a little over a year ago. Some good info there.

I was thinking about using copper tubing for the loop, but with the area
being a variable, I'm considering using something more flexible. Or
maybe finding out the area by experimentation, then going with a final
loop area in a neater form.

Thanks much!

The quarter-wave antenna's height above ground has much more to do with the elevation angle than the fact that the antenna is a quarter-wave ground plane. Using EZNEC, I see that a quarter wave antenna situated 3 wavelengths above real/high accuracy ground of medium characteristics has a main lobe 4 degrees above the horizon. At that angle, the gain is 5.1 dBi. You can confirm this if you have a copy of EZNEC.

Owen -

I've had this nagging idea for a couple of years: What if the (single-turn?)
loop passes through a toroid which already has, say, 10 or so turns on it?
That should give an impedance step-up of 100 or so. Would that not be a good
way to at least get the matching closer? In fact, the tuning capacitor could
be connected to the high impedance side to reduce the capacitor's value.

Your comments will be appreciated.

John

This has been done in a variety of ways (notably some papers from 20
years ago where they used this scheme to couple to the windshield window
frame on a jeep.

For Rx only, there's no real issues

For Tx, though, a small loop will tend to have high currents. There's a LOT of energy stored in the magnetic field (and in the E field of the capacitor that tunes the system). All that reactive energy will be flowing back and forth through the transformer, so it will need a high VA rating.

Consider this.. if the loop has an electrical Q of, say, 1000 (which isn't unusual), and you're radiating 100W, then there's 100kW of circulating power in the system.

If you're just looking for a portable vertical antenna, just a wire on
the end of the coax, and hanging it up, works pretty well. The shield of
the coax (outside surface) serves as the other half of the dipole.
Heck, it will have a bizarre pattern, and couple RF everywhere, but
you're talking about an antenna you're hanging out of a hotel window or
something.. You're not doing earth-venus-earth radar tests... you're
just getting the antenna away from where you are sitting to "outside"..

The velocity factor of the twinlead might be as much
as 20% different from the copper tubes. If you use
the same dimensions, the resonant frequency will be
too low. Did you compensate for velocity factor?
Did you check the resonant frequency with something
like an MFJ-259B?

By changing the characteristic impedance of the
matching stub, you change the optimum tap point
on the stub so you cannot use the same dimensions
as the copper tube antenna.

Seems you need to make the adjustments using a
throw-away version of the antenna. Once you determine
the proper dimensions, you can build the final version.

I would start by shaving the insulation off both
stub wires so they can be soldered to the coax and
chopping off 10% of the length of the 1/2WL section.

Usually not a problem since 1/4WL of RG-11
at 4 MHz is only ~40 feet - hopefully less
than the height of the antenna. 1/4WL at any
higher HF frequency would be shorter than that.
Excess coax can usually be coiled into a choke.

Nope, the 100k joules/sec was stored in the system
during the initial transient key-down state and was
not radiated. It won't be radiated until the transient
key-up state. This is a characteristic of standing-
wave antennas. In a 1/2WL dipole, only about 20% of
the energy stored in the antenna is radiated. In the
small loop above with its astronomically high SWR,
only about 0.1% of the energy stored in the antenna
is radiated during steady-state.

not at all.. that's the definition of Q.. it's the ratio of stored
energy: energy lost in 1 cycle.

> provide useful performance without being too large. . .

A quarter wave ground plane (with or without sloping radials), a J-pole, and a vertical dipole all have virtually identical patterns provided that the outside of the feedline can be adequately decoupled. In free space, the maximum is directed to the horizon. In a real installation, height above ground and reflections from other objects will modify the elevation pattern, in the same manner for all those antenna types.

The patterns of all these antennas can be affected by current conducted to or induced on outside of the feedline. Those with EZNEC or other modeling program might find it interesting to attach a vertical wire to the "ground" side of the feedpoint and extending downward to represent the outside of a feedline. An effective current (choke) balun can be simulated with a 1k ohm resistive load inserted in the wire. You'll find considerable current can occur on the wire when it has particular lengths, the lengths depending on whether the bottom end is grounded or open, and placement of "baluns". When the current on the wire is high, considerable pattern distortion can result. I've always supposed that this is the cause of widely differing reports of the effectiveness of a J-Pole -- some people get luckier than others with feedline length. A pair of current baluns, one at or near the feedpoint and another about a quarter wavelength below, are usually enough to suppress the current on the outside of the feedline to a low enough value to prevent pattern distortion.

It doesn't.. it's that the circulating energy in a high Q system is
quite large, so you need to size the transformer (core) appropriately.

The transformer size needed to handle a 100W Tx in a resonant dipole is
MUCH smaller than the transformer needed to handle a 100W Tx in a
compact loop with a Q of 1000. The transformer has to handle not only
the input(and radiated) power, but also the circulating power.

Actually, ALL the components have to deal with the circulating power,
but most builders of compact loops are aware of the need for low
resistance in the loop and high voltage ratings in the capacitor.

The 1/4 GP with sloping radials and the 1/2 wave are so close in
performance to almost be unnoticeable if both are mounted in
the air say at 30 ft. The two antennas will have almost the same
pattern at almost the same exact angle. When modeling both
at 30 ft, the GP's maximum is at 2.7 degrees, vs 2.6 degrees
for the 1/2 wave. "145 MHZ".
The GP's performance will vary a bit due to the number of
radials, but in general the difference between the two antennas
will amount to about .3 to .5 DB. Not much.
This does not take into account common mode currents.
In some cases, I bet it's possible for a 1/4 GP to outperform
a J-pole if the J pole has no decoupling from the line.
Myself, I've never used a J-pole. I prefer a gamma loop
type match if I build a base fed 1/2 wave. I don't like
the matching device to be parallel with the radiating element.
Most of my "simple" 2m verticals are 1/4 wave GP's.. :/
I have one in the attic hung from the rafters. It has either
6 or 8 radials.. I forgot which.. Been a long time since I've
been up there. If you use more than 3-4 radials which is
the norm, you will see an increase in performance.
I think more due to better decoupling of the line rather
than less ground loss. At 30 ft, ground loss is not much
of an issue as long as the antenna is complete. Just one
radial will make for a 1/2 wave vertical dipole of sorts, and
ground loss should not be much of an issue at several
wavelengths in the air. So... I think the increase in
performance is more due to better decoupling from the line.
Either type can use further decoupling techniques for
improved performance. The GP will usually use a 2nd
set of radials 1/4 wave below the main radial set.
The same scheme can be used for the 1/2 wave if
common mode currents are a problem and skewing
the pattern up off the horizon.
In many cases, decoupling of the line is more important
to gain at a low angle than element length.
Does no good to use a longer element if line currents
skew the pattern upwards.

Is it vanity to think that since the repeater is full quieting on their
end with their rubber ducky, then their signal must be full quieting
into the repeater, or vanity to wish such people would use a j-pole?

>lead, but SWR is very high and it seems to be not adjustable to the same 1:1
>of the first antenna. Why? Does anyone know where is the problem? Could be
>the clear cable plastic not good for the application?

The impedance of "300 ohm" twinlead is often not very well controlled... it can vary quite a bit from one manufacturer / batch to the next. It's quite common to find it necessary to adjust the lengths of the radiator and matching section, and the position at which the feedline is attached, in order to get a good match. The distance from feedpoint attachment, to the bottom of the matching section, seems to be quite critical (this appears as a shunt inductance across the feedpoint, and small differences in length can make a bit difference in the reactance seen at the feedpoint).

Once you figure out the exact segment lengths you need for a particular lot of twinlead, you can usually reproduce this design quite quickly... but only as long as you use that exact type of twinlead. Switch to a different type and you'll have to do another round of trimming-and-tweaking.

I have no reason to believe that the clear-dielectric twinlead is any worse than brown- or black-dielectric twinlead, in terms of your ability to achieve a good match. They just have slightly different imepdances and velocity factors, and so need different trimmings.

It may also help to add a choke to the coax feedline, just below the point at which it's attached to the twinlead. This will isolate the outside of the feedline from the antenna, reduce RF currents on the feedline, and make the antenna's effective impedance less sensitive to the position and length of the feedline. Try a snap-on ferrite two-part core.

A few years ago I made a J-pole for my bicycle, by taping wires to the side of a fiberglass bicycle-flag mast... no twinlead was used. The lengths of the various wires ended up being a *lot* different than what I would have needed for a twinlead J-pole in free space... the relatively high dielectric constant of the fiberglass had a very big effect! Figuring out the correct length for the below-the-feedpoint inductive shunt section was the trickiest... I used bare copper wire for the two sides, wrapping a turn or two of bare stranded wire around the pole to form the short at the bottom, and moving the short up and down until I got a good match. It ended up being quite a bit shorter (if I recall correctly) than a standard twinlead J-pole would have required.

I'm not doing that, Jim, just trying to lay the old ones to rest, e.g. a 3 nS delay through a 10" long 75m bugcatcher loading coil. Please don't tell me that you believe that a 4 MHz signal can travel through a large 10" inch coil in 3 nS - a coil that exhibits a VF of 0.04. That's about seven times the speed of light.

Cecil had something to say like that(different figure) and I find it
quite interesting!
The idea of a loop antenna acting as a battery I find odd. The loop is
a tank circuit
where the power supplied replaces the power lost in the resistance of
the components
Without the resistance it would be continual motion! So where is this
"radiation" ratio coming from as the power supplied is purely a
replacement of resistance losses which includes the energy supplied
for radiation? The voltage is in the kilo volts but with current
extremely low I fail to see where the 100kW comes from which makes it
a
battery

I must have missed something. I did not realize that Michael intended to use the loop with a 100 watt transmitter. My assumption was that it was primarily a receiving antenna.

However, it doesn't matter because your comments are equally applicable to a short wire antenna. Therefore, I would urge readers not to consider the small loop any worse than a short wire antenna in these regards.

I doubt that the transformer you propose would be near as efficient as the transformer formed by a smaller feed turn. Though it is tempting to explain a transformer using turns ratio, the case of the smaller turn is explained by the ratio of main loop flux intercepted by the feed loop, and that is determined by area... so deforming the feed loop to change its area will adjust the transformation.

Thanks for your reply.

So, as I understand it, there is a large main loop that does the signal capture. Then there is a smaller loop kind of co-axial with the large loop and the loops are not electrically connected. Yes? The small loop is a signal pick-off? Similar to a transformer but with no core?

I seem to recall that a small loop has less inductance than a large loop. I also seem to recall that the transformation between them is a function of their inductances. So, a small loop would transform the larger loop's impedance to an even lower impedance. Is this not so?

John

Given that the speed of light is roughly 3 x10^8 meters per second, and it would ordinarily take less than a nanosecond to traverse the 10", it's not *THAT* unbelievable. The delay would depend on the series inductance and shunt capacitance of the coil. What are those numbers?

You can think of it in terms of inductance, but visit what inductance
really means (ie the relationship between inductance, current and flux).

I gave you an explanation in terms of area of the two loops. If your feed
loop os 20% of the area of the main loop, it intercepts 20% of the flux,
the voltage induced in the feed loop is 20% (1/5) of the main loop
voltage, the impedance is transformed by 1/(1/5^2)=25, so a 2 ohm main
loop is transformed to a 50 ohm load at the feed loop feed point.

Now you can expand that and write it in terms of inductance... but Mike
can measure the loop dimensions with a ruler and calculate area.
Measuring inductance of the components is fraught with problems.

So, if Mike works out what the radiation+loss resistance is of his main
loop, divides it by 50, takes the square root, it gives him the portion
of the main loop area to be occupied by the feed loop. Initially, one
might make the area of the feed loop 20%-50% larger and squash it to fine
tune the transformation ratio.

Interesting Jim but just a small bit of knowledge. The Cern experiment
scheduled to start this year seems to me to be an attempt to stop
particles in their tracks faster that the Earth's atmosphere can. When
this passage of particles to Earth spiked a few years back our grid
became vunerable and the Northern lights were so bright they could be
seen as far south as the equator. Now Cern wants to stop the Neutrino
particles from the Sun by "impact" which suggests a coming presence of
Hallium that can create explosive pressures such that artificial
diamonds are readily made. When this experiment takes place it
suggests that radiation will really peak for a short time before we
all become incinerated. But the some scientists are comfortable that
all that can happen is known.
Well at least to the best of their knowledge
and in the short term ,
we think,
we hope!
And we have not figured out radio radiation yet, even tho we have a
multitude of formulae from a century ago!
Fortunately the Sun has not burnt out and solar particles are still
making it to Earth as the Sun's arbitrary border expands and fractures
as well as the coming radiation fractures in Italy

Art, please do not include the majority of us here in your statements.

What you really should be saying is YOU have not figured out EM radiation yet.

I for one can design and build, with the help of STANDARD TEXTS (especially those many decades old!), almost any type of antenna or antenna array anyone could ever need. And it will work exactly as predicted if one takes into account normal environmental variables, such as buildings, trees and ground conductivity.

This isn't unknown unpredictable territory, regardless of your claims, none of which have been proven, by the way. This stuff works, and we know how, and it's not the way you claim.

Speaking of texts, one of my co-workers gave me a wonderful paperback
textbook last week "The Theory and Design of Circular Antenna Arrays" by
James D. Tillman, Jr., The University of Tennessee Engineering
Experiment Station, 1966.

The design, testing, scope pictures and the wonderful racks of gear they
built makes for a great piece of work.

I have no idea why he had this book or where he got it, but am grateful
to get it.

Whoo aren't we sensitive! If the books say radiation is not "fully
understood "(. Tom with one exception Tom OK?) I will take them at
their word, well, at least until I publish the rest of the
story..GDay
By the way Tom, anybody can design an antenna as it is very hard for
them not to radiate but to design an antenna that is more efficient
than the present state of the art that is something else. For your
information you have never built an antenna that conforms in its
entirety to Maxwell';s laws thus you cannot possibly understand
radiation as presented by Maxwell. For instance, Einstein studied
Maxwell's laws in the hope of finding the properties of the "weak"
force. He failed. He then decided to move away from standard physics
to look at things from another view point but still failed. I know of
no books that illustrate the use of the "weak" force with respect to
radiation so would you say from your experience that Einstein was
wrong? Even the books do not print that suggestion. Now one scientist
has stated that radiation can be a point source which means the
radiation sphere of a radiator is of equal value at all points around
the arbitrary border, which of course is correct, and we are not
talking averages either. Pray tell me how I should go about making
such a radiator and what book is it to be found?

Best regards and lighten up
Art

Did it state that radiation was waves or particles and how he can
prove it ?
Is this in line with your extensive design of antennas?

What ever is the matter with you? You seem to want to pick a fight for
some reason.
So you are a qualified antenna engineer and you dislike my aproach to
antennas because I am a mechanical engineer or what. I experiment with
antennas which means I am not totally governed by the books and I
enjoy that. I also study so that my results can be understood
mathematically. Now I am not an antenna engineer but when you and
others
could not relate the mathematics of Gaussian statics to Maxwell I
realised that the so called gurus were not experts after all and this
was confirmed when the term equilibrium flumoxed all of you. Now you
claim efficiencies of some sort, does it show up on a receiver S

metre? I doubt it. And you claim 98% efficiency but supply zero parameters.Heck, I can get a computer program to give me figures better than that but it is meaningless
But all of this really doesn't matter on this newsgroup, I am not a antenna engineer so in no way am I encroaching on the esteem you feel you posses as a antenna engineer because of your electrical background. Yes, you know more about antennas that is written in the books, because you committed it to memory whether it was correct or not to pass an exam. Feel better now?
Sleep well

What exactly do counterpoise wires do for a vertical antenna? I realize that they allow an impedance match, but what is physically going on with the current that makes this possible?

3394. Re: Sun Spots

Newsgroup: rec.radio.amateur.antenna

> And which books say it's not understood? Be specific, give examples.
>
snip>

Now now Tom, there is no need to lie to make a point. I said "fully
understood" big difference
Now to the books. A common title "fields and waves" What on earth have
waves got to do with radiation? Seems like the Moon makes waves and
people like you,and this thread is listed as sun spots ! Which is
correct?. I know, what ever the professor said as he determines who
passes or fails. Now as a mechanical engineer I have read no
explanation
as to how waves provide radiation because that is not fully understood
by those who write the books But now Tom, as an esteemed antenna
engineer and designer, you are now in a perfect position to explain to
all the little people how that actually works because you Tom
are an expert by your own words You fully understand radiation and
antennas. We also have the standard model which consists of the four
forces so educate the rest of us by explaining what force is used to
make waves that create communication. You ask for specifics well now
you have them. Time for you to provide answers or don't you have any ?
Now to the antennas that you have made, I warrant all of them were
planar probably Yagi's but as a electrical engineer you surely are
aware of Maxwell's laws with respect to radiation so why did you make
antennas that does not account for all forces involved as per Maxwell?
On top of that, there is no mention of waves in any electrical laws so
why does it keep coming up with respect to radiation? Still no answers
Tom Heh? So why is it that you now want to pick a fight with me?
Because we disagree on the means of the creation of radiation?
Sleep tight tonight

>What exactly do counterpoise wires do for a vertical antenna? I realize
>that they allow an impedance match, but what is physically going on with
>the current that makes this possible?

You can think of a counterpoise (somewhat simplistically) as "the other half of the antenna".

Start by considering a half-wave vertical dipole, fed in the center with coax. Equal-but-opposite currents flow out of the coax (from the center conductor, and from the inside of the shield) and into the radiating elements. Let's assume for the moment that the outside of the feedline is decoupled/choked (e.g. there's a 1:1 balun at the feedpoint) , so that current can't flow back down the outside of the coax. In this situation, equal currents flow from the coax onto the two halves of the dipole... and since they were opposite in direction inside the coax, and since the dipole wires go in opposite directions, the currents on the two halves of the dipole are in phase, and the RF fields created by them reinforce one another. Power flows efficiently from the coax to the dipole (reasonably low SWR, depending on coax impedance and the presence of nearby conductors) and you get a good signal on the air.

Now, take away half of the dipole... creating a vertical monopole, with no counterpoise.

You still want current to flow into the half-dipole... but you've got a problem. Current can flow easily from the center conductor of the coax to the vertical... but there's no good place for current to flow out from the inside of the feedline shield. It can't flow onto the lower half of the dipole (that's gone) and it can't flow back out along the outside of the feedline shield (the balun prevents that). Instead, the flow of current just stops... there's a very high impedance at the end of the coax shield (how high depends in part on how good a balun you've got). Instead of there being 70 ohms (nominal) of impedance at the feedpoint, there could be several thousand ohms (35 ohms from the vertical, and the rest from the abrupt current-stop at the end of the shield). You now have a terribly high SWR and can't get a signal out.

Now, fasten one or two wires to the coax shield (right by the feedpoint, on the antenna side of the balun). Cut 'em to 1/4 wavelength. You have now restored the current balance of the antenna... current coming out along the inside of the feedline can flow out along this wire (or wires), balancing the equal flow onto the vertical radiator.

If the wire(s) droop downwards (directly below the vertical) then you've completely restored the dipole... you'll see a 70-ohm (nominal) impedance at the feedpoint.

If, instead, you run the wire or wires out sideways, you'll see a different (lesser) impedance, and the antenna's radiation pattern will be somewhat different. Two 1/4-wave wires, stuck out in opposite directions, at a 90-degree angle to the vertical, form a simple basic "ground plane" antenna, There will be equal-and-opposite currents in these two wires, and the net RF radiation from them will be zero. In the simple case, in free space) you'll see an antenna feedpoint impedance of around 35 ohms.

Counterpoises can be used with more complex types of antennas, as well (i.e. with radiators other than 1/4 wavelength). In each case, their basic purpose is to create a "total antenna length" (radiator plus counterpoise) which is resonant or nearly so, so that currents flow easily from the feedpoint (seeing a convenient amount of resistance, and little or no reactance) and an efficient matching of feedline to antenna can be achieved.

If, instead of using a counterpoise, you simply don't put a balun at the feedpoint... then you may or may not end up with antenna which works acceptably. In this situation, the outside of the coax serves as a counterpoise-of-sorts. Whether it works well (allows for a decent match/SWR) is going to depend on the length of the coax and its grounding arrangement and its path.

This is why you sometimes hear people (particularly in the CB community) being very concerned about adjusting the length of the coax from radio to antenna, in order to get a better SWR. Whenever you hear this, you can be pretty sure that you're dealing with an antenna which isn't balanced and doesn't have a well-designed counterpoise or grounding arrangement, and the feedline is actually serving as part of the antenna (and often radiating RF where it isn't really wanted).

Just a guess, but maybe it deals with the Wullenweber [or Wullenwever]
antenna, described here http://en.wikipedia.org/wiki/Wullenweber and
elsewhere.

The article cites Hanza, Okinawa, Japan, where I was stationed in 1965/66
and worked inside the antenna building. The basement was filled with
multicouplers and several very large spinning goniometers to pick off the
desired signals. It also cites the array at Imperial Beach, which is not
far. I see it several times a year but it was abandoned years ago and may
be coming down. I wonder who gets all that nice RF cable.

Yes! All of the above!

Also, it has been my experience that the recommended quarter-inch gap cut in
one of the twinlead conductors [to create the stub section] is insufficient.
I make it at least a half-inch.

> I'd go with whatever seems easiest to make and easiest to mount in your
> particular situation.

Amen. I have long been a fan of the copper pipe J-pole.. I've built about
two dozen of them over the years, 6m, 2m, 220 and 440. We have three of
mine on the local fire station for RACES. We go up on the roof and retape
the connectors every few years -- that's it.

My only deviation from the many Internet plans has been the inclusion of a
100 pF cap inline with the center conductor at the feed point if the VSWR
minimum wasn't 1:1 somewhere in the band after the first couple of tries.

Yes, you should choke the feedline, if not with ferrites, then with a few
tight turns of the coax.

The copper pipe j-pole can mount to almost anything; there's no significant
RF current in the lowest pipe section (below the J).

That is wrong, isn't it? What was I ever thinking?

The main loop isn't anything like 2 ohms at resonance, it is much much
higher, and the voltage is quite high for a given power.

The reduction in flux cutting the feed loop means that feed loop voltage
is reduced proportionately to area, and therefore the impedance (in a
lossless system) would be decreased by the square of the voltage
reduction

>
> This is the part with which I disagree. Can you show me why it is 25
> rather than 1/25?

It is, but it is not 2 ohms that is reduced, it is something much much higher.

Thanks.

Owen

You all know how. You have yours own STANDARD TEXTS. But I do not know the
one thing. Which part of the antenna radiate.
See;
(http://people.seas.harvard.edu/~jones/cscie129/nu_lectures/lecture6/hertz/Hertz_exp.html

"According to theory, if electromagnetic waves were spreading from the
oscillator sparks"

The theory is from XIX century. The oscillating sparks are in the centre of
the Hertz dipole.
What do you assume in your predictions. Are the radio waves radiated from
the end (no current) of an antena or from the places of the wire where the
current is max?

both, and neither, art's radiation comes from magical levitating
antidiamagnetic neutrinos from the sun that jump off of antennas when the
current flows.

>was confirmed when the term equilibrium flumoxed all of you.

because equilibrium has no place in electromagnetic radiation which by definition is a flow of energy, therefore not in equilibrium... no flow, no radiation... so your magical equilibrium antennas can't radiate, which is pretty much what everyone agrees on.

3405. spider at height

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-30 11:31:34 UTC
From: ml <m@di.net>
Message-ID: <m-425DD2.07313430052009@news.optonline.net>
Source record: 15229

hi

I was reading about a few different variants of the spider beam type multiband HF antennas.

A few of the designers seemed to indicate to me that the antenna works 'best' ground mounted at around 30-40 feet or so but not greatly higher.

When I asked if it would work 'ok' on the roof of my building at 100+ feet was told no way over 40ft it would work poorly

It started me thinking, I couldn't really see why it wouldn't work or work better at height, or at least as good

I do understand potential for change in radiation angle, but not why the antenna gain would take a dive

the kinds i've seen seemed to be either moxon like kinda simular so I would think that these designs would be fine at height if not better (for certain things)

anyone think of something i might have overlooked in the spider like designs that would actually 'kill it' at 100ft? (talkin about gain/electrical performance NOT wind damage)

just couldn't see anything that would prevent it from working at height

thanks

Gauss's law of Statics is the subject law.
Waves have no part in that picture can'tyou get that into your head.
The Moon creats waves The Sun does not
Again "statics" which is the subject of particles is what I was
talking about.

Ok, you capitalize that as if it were a specific law... provide a reference,
other than your own posts, for "Gauss's law of Statics". If you can't do
that, provide the specific equation you are refering to.

It is unbelievable for a device with a VF of 0.04
Do you understand how to include VF in a calculation?

> The delay would depend on the series
> inductance and shunt capacitance of the coil. What are those numbers?

All of those factors are included in the calculator at:

http://hamwaves.com/antennas/inductance.html

Tom's coil is 100 turns, 50.8mm coil diameter, 254mm long,
wire diameter of 1.024mm, and frequency = 4 MHz.

With a wavelength of 75m, exactly how does one obtain a
3 nS delay when the propagation factor is 2.12 radians/meter?

Visualize a 1/2WL center-fed dipole with one element
laying on the ground. The wire on the ground is the
counterpoise. What happens to the radiation when the
wire is laying on the ground?

The velocity factor of the insulated twinlead is much
lower than bare wires. If you don't understand velocity
factor, please study up on the subject. Velocity factor
can make as much as a 20% difference in element lengths
between bare wires and insulated twinlead. The
characteristic impedance is also different causing the
50 ohm feedpoint position to change.

Hi Owen,

By your latest comment, it appears you have jumped off the rails
completely. Let's look at the spec:

On Wed, 27 May 2009 13:36:53 -0400, Michael Coslo <mjc5@psu.edu>
wrote:
>It's Octagonal, .75 inch copper tubing, around 8 feet in diameter. It's
>designed to just reach into the 80 meter voice segment with it's
>capacitor setup.
which through any of several methods reveals radiation resistance
equals 0.27 Ohms. The need for large conductors, high voltage
components, and loop (which, for 80M would be half a meter) coupling
to obtain the proper match are all found in their proper
relationships.

>Upper end is either 17 or 15 meters.
where the ratio of the physical dimensions to the wavelength (roughly
half wave) renders a much higher value.

Reggie covered all of this years ago. Unfortunately, he buried the
best of his legacy in a drift of bantering making it an extreme chore
to mine Google for the relevant postings.

I'm thinking jealousy my enter into their thinking. Using a vertical antenna cut for one or two bands worked better for me the higher I went. A friend has an all band that the factory says mount on the ground with at least four long ground radials out from the base. It's around 35 feet tall, but all bands don't work equally well. The higher the frequency the lower the effectiveness of the antenna. Maybe it would work okay higher, but the ground field may not be a effective. Just an observation.............KD0FGX

If you are using such construction, why not just build a coax type of
colinear? It isn't so difficult to add a section of outer shield for
decoupling. Have you priced PA hybrids lately?

BTW any degree uptilt is usually worthless unless you are deliberately
limiting coverage to the horizon. and anything significantly higher in
elevation is line of sight anyway. For ground level base station or
repeater that covers a localized area, a J-pole is attractive because of its
broad pattern that allows numerous reflections through and between the
buildings. I've been told that an upside down ground plane ought to work
better, but it doesn't

Earlier Art wrote: "For your information you have never built an antenna
that conforms in its
entirety to Maxwell';s laws thus you cannot possibly understand
radiation as presented by Maxwell. For instance, Einstein studied
Maxwell's laws in the hope of finding the properties of the "weak"
force. He failed. He then decided to move away from standard physics
to look at things from another view point but still failed."

So Art is looking for the next theory. It is a good way to know the results
of experiments. Maxwell did not see the antenas. You all do. Tell than us
which part radiate the radio waves.

Bob D. -

Please don't take my comments as being negative about a J-Pole. I happen to like them for other reasons. They can be made very rugged. The few I made started out as a 30-foot mast. 3/4 wavelengths down from the top I mounted a horizontal metal bracket. To that I mounted a vertical 1/4 wave tube. I then used automotive hose clamps to connect a 1/2 wavelength piece of coax near the bottom just above the horizontal bracket. I adjusted the connection point of the coax to find the lowest SWR point and then replaced the 1/2 wave piece of coax with my longer lead-in. I put some weatherproofing on the coax.

I ran 10 gauge wire from my nearby ground rod over to the bottom of the mast. What I like about this arrangement is that the entire assembly is grounded. I once had a nearby lightning strike cause my IC2AT to block signals for several seconds while I was listening to a local repeater with a

home-made ground plane. Charge buildup, I guess. That never happened with my J-Pole. That thing worked flawlessly for several years until I replaced it with a commercial dual-band (expensive) antenna.

Have fun.

73,
John

Source record: 15244

Nearly all horizontally polarized antennas of a few elements have a very broad free space elevation pattern. So when mounted over ground, they all tend to have nearly the same elevation pattern (except for front-back directivity), dictated primarily by the height above ground. In other words, a spider beam, quad, or two or three element Yagi has about the same elevation pattern as a dipole at the same height. There are some heights which are particularly good, and some which are particularly bad, for working stations certain distances away because of the elevation angles where the maxima and nulls occur. But those heights are essentially the same for dipoles, quads, and Yagis as they are for spider beams.

I couldn't find such a list, but you might find reading this old eham
thread useful for explaining why there are no such lists:
<http://www.eham.net/articles/10077>
How friendly do you want? No tower restrictions of any kind? There
are various degrees. For example, just about any city or county that
has a tower ordinance, will tend to restrict the installation of ham
radio towers in some way. If you're serious, just check with the city
or county planning department for tower ordinances. You'll also find
that tower policy is highly dependent on those making the decisions.
Without rigid guidelines, a traditionally friendly planning
department, might easily become hostile if the composition and
membership changes.

Good luck.

Most rural areas are very ham friendly when it comes to antennas but
you can get blamed for every flake of snow on their TV. I was once
getting blamed for periodically wiping out all the TV in about 4
blocks. It turned out that one of the people who complained to the FCC
about me owned the source of the problem. Her antenna mounted preamp
would break into oscilation.

Anyway I have found that most places where you can find $300K+ homes
in close proximity to run down mobile homes is usually pretty ham
friendly.

Heh I just want you all to keep posting regarding your knowledge of
antennas. The more you post the more you reveal yourselves. I was a
mechanical engineer not a antenna or electrical engineer so I am
struggling just to get on the ladder of knowledge. There are a few
here that feel they are best qualified to judge with respect to
antennas. I just can't make them out. Now we have Tom competing for
the top spot because he has made antennas to work and is anxious to
let everybody know about it Yup 98% efficient he states
That 98% of radiation that went to the wrong place.What has he
accomplished that nobody else has done Now where did that other 2% go
possibly hiding inside the radiator tube? Has he accounted for a
everything involved in the generation of radiation? Does he know what
radiation is and what creates it? Now will somebody explain to me why
the subject
of waves keep coming up when radiation is discussed and do the waves
tip over when they get to their destination and dump dots and dashes
all over the place? Every body is keeping mum as to what creates
radiation because none can answer the question They only can ask
questions to divert the spot light else where. Perhaps the "tide" has
turned with respect to Maxwell and it is time to surf the "waves"!

not even close, art has him for crackpot theories hands down.

>Every body is keeping mum as to what creates
>radiation because none can answer the question.

you haven't asked that question, you have stated your theory about magical
levitating anti-diamagnetic neutrinos. according to Maxwell's equations as
supported by detailed observations and calculations over the last 100 years
or more, accelerating charges create radiation.

It has this coooool name that gives it at least 3.78dB advantage over
the name J-Pole (which, for the same nominal advantage (nominal
meaning name), has about a 5dBd gain over a rubber ducky).

If you want another 3dB nominal advantage, tag the word fractal to it:
Slim Jim Fractal J-Pole Antenna
of course, this being crass and a populist slant toward CBers, you
could tart the name up with academic trappings:
Slim Jim Fractal Gaussian Particels J-Pole Antenna
without bringing so much as 14.2dB loss for your effort.

Through the simple addition of a 2 meter sized dish, you can make it
omindirectional on the 160M band.

My reckoning:

I ran up a model in NEC of a vertical circular loop of 2.4m diameter,
made of 19mm dia copper conductor, and located with its centre 3m above
average ground.

The feedpoint impedance is 0.13+j168 at 3.5MHz.

If that was resonated with a lossless capacitor, the parallel load
impedance would be about 220k+j0.

To transform that to 50+j0, the impedance ratio is 4400:1, the voltage
ratio is 4400^0.5:1 =66:1, the areas need to be in a ratio of 1:66, the
diameters (for circular feed loop) 1:66^0.5 =1:8.1. The feed loop would
be about 12% of the diameter of the main loop or about 0.3m.

...

Reg did leave us a calculator for this problem (MAGLOOP4) but without
(AFAIK) documentation of the method used. MAGLOOP4 comes up with slightly

different figures to my NEC model, slightly higher loss, slightly lower main loop // Z, slightly larger feed loop.

WInegard makes an antenna-in-a-box, the SS-1000 which lists ~4 db gain over the UHF TV range:

<http://tinyurl.com/nqpzm2>

I must say at the outset that I am hesitant to buy an antenna based on its form-factor, but I'm forced by the local code to not display bare-element type antennae on the mast.

I do like the panel style for the reason that I can arrange 3 around a common mast, aimed at remote cities, and join the outputs for increased coverage.

Has anyone experience with the SS-1000? Or can recommend a similar style antenna?

Thanks.

I have *serious* doubts about the analysis in that article.

I believe that the author's assumption that splitting the radiator current in half, and running it through two parallel elements, has the effect of increasing the gain and dropping the takeoff angle is incorrect.

The analysis I've read on Cebik's web site of J-poles of various sorts seems to make no mention of this alleged effect. Nor have I seen it discussed in writeups of folded dipoles.

If increasing the gain of a half-wave dipole were as easy as that, it'd be a lot more popular a technique, and much better known.

I believe that a "slim jim" might have a slightly wider bandwidth and/or lower resonant frequency than a single-wire J-pole of the same dimensions, but more gain? Unless somebody's got independent evidence of this (measurements or a good NEC model) I'd take it with a good-sized grain of salt.

The plastic tube had mostly air between the conductors.
The insulation on 300 ohm twinlead or window line is solid
dielectric around and between the two wires. VF is easy
enough to measure with something like an MFJ-259B.

I measured the VF of 300 ohm window line at 0.8

That's a silly question Tom it is the pattern that matters to me.
Anyway it was 100% and the pattern was a ball which to me is what I
wanted i.e. equal pressure on all boundary points which is absolute
equilibrium. The 100% figure is nice but the program worked it out not
I. Any way the scientist was correct on his theory with respect to
"point radiation" unfortunately, like others,,, he passed away
My other desire is to make the radiator as small as possible and I
solved that some time ago as well as a frequency response that makes a
log periodic look ancient.
Now your turn ! You have had enough questions and I have asked for
just one and that is the action and manner of waves, but you can't
seem to answer that one so I will provide another.
Radiation is a result of an accellerated charge is what all the books
say , what is the nature of that charge such as mass and what force
created that acceleration? Now if you are the expert that you say you
are then you will have to answer a question sometime or your perceived
status will come under scrutiny and David can be very difficult at
times with his questions never answers but questions only questions.

Well if you took them and added Chris from s.p.fusion, you'd have an
amazing trio. Chris, to be fair, actually builds things and truthfully
reports the results, makes modifications when it again fails, does more
calculations, tries agains, fails again. He just thinks, similar to
Art, that he's the only one that knows the "secret". Well sort of,
you'd have to read his stuff.

Well it depends on what the programmer refers to as efficiency. It
could also mean all forces accounted for and when summed equals zero
as reflected by the radiation ball
and as you say it also accounts for losses. I'll wager that is what
all antenna programs refer to as efficiency. Either way it is only 2%
higher than the figure you were boasting about and yet you believe
yours. Selective analysis?

Actually, unlike Wullenweber, they have multiple concentric rings of verticals in the array with a complex phasing system. My guess is that this may have been a contributor to the methods eventually used in phased array radars. But also something that was an engineering study, and not necessarily practical.

Engineers get to judge. It's part of our job. It's why eventually we
learn enough make buildings and bridges that don't fall down.

And it's why we don't allow people like you design things that need to work.

That's the way it is. You may not like it, but that's just too bad.

Nobody has proved that

3453. Baluns & tower project

Newsgroup: rec.radio.amateur.antenna
Date: 2009-05-31 03:18:09 UTC
From: MTV <volztexas@comcast.net>
Message-ID: <YFmUl.66684$4p1.167@en-nntp-03.dc1.easynews.com>
Source record: 15177

Any advantage to having a B&W balun on a yagi vs "6 coils of feedline?"

Reason I'm asking is that the B&W 5K I happen to have specifies "SWR less than 3:1". I know over almost any and every one of the five bands my new beam covers (10, 12, 15, 17 & 20M), it'll be higher than that at many points.

I'm putting up a 7 element full size Mosley Pro 57B I got from W5KDG in Spring, TX a few months ago. What a job!

It's going on a 50' Glen Martin HD aluminum "Hazer" tower. The hazer includes the Yaseu 1000 rotator and 8' mast for antennas, and cranks up from ground level. I also have a Cushcraft (6M, 2M & 440) beam at the top of the mast. (Mast reaching above the tower is about 4'). The Mosley will be 5-6" above the top of the tower to clear when turning. Probably have some interaction with the tower and guys being so close? Three 3/8" stainless steel guys are fastened at the very top of the tower and broken up with insulators. I figure the height will probably be the biggest factor for stronger signals.

I'm now in the process of running five cables: 4 of RG/213 coax, plus one for the rotator, down a "messenger line" (also 3/8" stainless cable) from the hazer and into my shack. The coax lines are for the UHF, VHF and HF beams, plus an Alpha Delta DX-A: 1/4 wave slopers for 160, 80 & 40M. FWIW: 50' of coax X 4 is pretty heavy!

For anyone's info: this is my "retirement project." Been licensed since 1957 while in high school, shortly after Sputnik was launched, but was busy raising a family, and never had the space for antennas like this. Also most neighbors here are horses which never complain. Hi!

No, you haven't proved anything. That's the way science works. We don't
have to prove you wrong, you have to prove that you are right.

You seem to have missed that part.

Be specific. Give detailed test conditions. Give exact design
specifications of the test antennas. Give detailed results of your test
measurements. Then someone else can confirm your results or not.

Are you afraid your antennas don't really work? You certainly could
prove prior art if they do. You've been claiming they do for long enough.

Quit hiding behind words and give concrete things that can be tested.

S--t or get off the pot.

Dave,That was my thoughts on it also. Two wires very close togethether
with in phase and more or less equal currents just adds up to a fatter
wire.

I've had one on the roof since Dec 2004 in 90274 35 miles from Mt
Wilson split 4 ways with no preamps. It's a fine little UHF antenna
and while they say it can do upper VHF, I have serious doubts. I'll
find out for certain in 2 weeks.

You may encounter some undesired affects from joining antennas. If it
works, fine, but if it doesn't, consider switching among the three at the TV
set(s).

The problem is that the prime signal will be "contaminated" by signal pickup
from the other antenna(s). The degree of contamination may or not affect
reception.

Good luck.

Earilier you wrote: "according to Maxwell's equations as
supported by detailed observations and calculations over the last 100 years
or more, accelerating charges create radiation. "

In the Hertz apparatus the charges (electrons) have at the centre the max
velocity and the acceleration equal zero.
At ends the situation is opposite. So your answer should be: "the ends
radiate of course".

It is very funny that engineers use electrons and do not know that in the
"Maxwell's equations" no electrons, There is incompressible massless fluid.
You here do not use the "Maxwell's equations". The teachers use them to
teach math.
Engineers use the empirical equations following the rule "accelerating
charges create radiation".

Dale wrote " Neither seems to have an interest in real world antennas. "

I have "an interest in real world antennas. " But only in the fundamental
evidences of wave propagation.
I am not preparing the new theory. The Your engineering theory suits me.
That from physics textbooks not.
In physics is the hydraulic analogy. It is usefull for DC. For high
frequences not. But Maxwell PROPOSED such model for HF.
After his death the electrons vere discovered. So Maxwell did not create
equations for electrons. Engineers use the empirical ones.

of course you are wrong. there is a smooth transition between the center
and the ends, that whole length radiates. you can't just look at the
boundry conditions, you have to consider the whole length.

>

Gauss's law is about charged particles, the one art so much likes to
distort.. and don't forget that the 'i' term is also about charged
particles moving... if they can move they are not imcompressible, and since
the force on them can be measured and accelerations are not infinite they
are not massless.

i.e. not quantized - which, strangely enough, leads to
Maxwell's equations predicting results that are impossible
to achieve in reality. Planck's constant is indivisible.

Doesn't NEC use the method of moments (MoM) which deals
with total current and isn't total current maximum at the
feedpoint (middle) of a 1/2WL dipole where the maximum
acceleration of electrons is taking place?

Thanks, G, for answering the question *asked*. I appreciate it. :-)

The issue re. rights may be interesting to some, but was not asked. (Man, the signal-to-noise ration on USENET is *so* low...)

If you think of it, please post a follow-up in 2 weeks.

Thanks.

I believe what Elmo says is correct.

Check out: http://www.fcc.gov/mb/facts/otard.html

which says, in part:

The rule (47 C.F.R. Section 1.4000) has been in effect since October
1996, and it prohibits restrictions that impair the installation,
maintenance or use of antennas used to receive video programming. The
rule applies to video antennas including direct-to-home satellite dishes
that are less than one meter (39.37") in diameter (or of any size in
Alaska), TV antennas, and wireless cable antennas. The rule prohibits
most restrictions that: (1) unreasonably delay or prevent installation,
maintenance or use; (2) unreasonably increase the cost of installation,
maintenance or use; or (3) preclude reception of an acceptable quality
signal.

In this ruling, the FCC pre-empted not only state and local government
regulations but HOA CCR's and landlords' restrictions on renters.

This came about because the broadcasters have a strong lobby, and they
didn't want widespread limitations on receiving their over-the-air or
satellite transmissions.

I would expect the 3:1 SWR limit is at the rated power.
Reduce the power level and the balun will survive an
SWR higher than 3:1. If it is rated 3:1 at 5 kW, hams
shouldn't have a problem with a slightly higher SWR.

I asked a question. I didn't ask Is my assertion correct? Assume it is
(regardless FCC mandates).

You (and others) decided to answer an unasked question.

But let's not drag this on. I'd like to hear from anyone who has used this
antenna or other like it.

Thanks.

Hey OM
This si just a rehash of another post awhile back in this here forum.
But DTV will never go away so:

I seen one on youtube, there are a tonne of them, but this, to the
best of my recollection, one used:

1pc 1x2 2ft long board
5 steel wire coat hangers
dry wall screws
and a 75 ohm to 300 ohm balun

to make a 4 bay bowtie antenna

Ideally that's 6 db over, just a single bowtie.

And an 8 bay bowtie would be 9db.

I the real world it would be slightly less

Capture area of stacked antennas is greater, so less UHF fading. Like
when the wind blows trees branches around and when cars and trucks go
by.

But nothing like watching a pixelated picture. Unless you got a good
memory in that set box.

4dB isn't very much gain. Compare this with some other available
antennas:
<http://www.hdtvprimer.com/ANTENNAS/comparing.html>
Unfortunately, the SS-1000 and SS-1000 are not listed.

Depending on the distance between your apartment and the antenna
location, the +4dB antenna gain may not be sufficient to compensate
for the coax loss. Are you in a weak signal or strong signal area? Is
an antenna amplifier justified? If so, you might need 3 amplifiers
for your 3 different directions.

Also, a 4dB gain antenna will not have a very directional antenna
pattern or be particularly directional. My guess(tm) is perhaps 120
degrees wide. There probably won't be much difference in signal
strength if your 3 directions are within the beam width.

>I must say at the outset that I am hesitant to buy an antenna based on its
>form-factor, but I'm forced by the local code to not display bare-element
>type antennae on the mast.

As others have mentioned, this is mostly incorrect. The problem is in
the interpretation of the word "unreasonable", which might be
interpreted in a variety of ways. Without details on your situation,
I can't comment on this.

>I do like the panel style for the reason that I can arrange 3 around a common
>mast, aimed at remote cities, and join the outputs for increased coverage.

Mast? Welcome to "unreasonable". The FCC 47.1.4000 clause that
limits antenna installation has nothing to say about the supporting
structure. While the HOA may not be able to prevent you from
installing an antenna, they most certainly will have something to say
about the design and construction of the supporting structure. They
may also demand that it be installed by a licensed and insured
installer to protect themselves against subsequent litigation. I know
you don't want to hear about all this, but methinks you should at
least be warned before blundering onward.

>Has anyone experience with the SS-1000? Or can recommend a similar style
>antenna?

No recommendations. Antennas are sized and designed to solve specific
problems. The design required in a strong signal area is quite
different from one in a weak signal area, in an urban canyon, for an
indoor installation, or if it is intended to be disguised or
minimalized. It's also important to know the lowest VHF frequency or
channel that the antenna is expected to operate as this has a huge
effect on the physical size of the antenna. Without a clue as to your
situation, it's impossible to offer an endorsement or alternative. If
you find it inconvenient to disclose such details, I suggest you use:
<http://www.antennaweb.org>
to optimize your selection and proposed installation.

Seeing that you are forced into this, you will suffer by the same
degree. In comparisons to others in the field, it is good by
technical standards - for UHF (low VHF is just hopes and dreams). In
comparisons to others in the field, it is mediocre by cost standards.

So you suffer in cost and coverage (if you want VHF); and form factor
is always going to reign.

This should come as no surprise, certainly.

>Or can recommend a similar style
>antenna?

To suffer equally? As you really lead with your chin ("local code"
and hewing to not arguing that line) and don't offer any technical
specifics (where you live, what stations, what directions, what
distances, what bands, what frequencies, what height mast - in short
nothing) you might fill a 16x16x4 inch box with low denomination
bills, attach a cord and see how that works. If it doesn't, then send
the cash filled box to Winegard and ask that they fill the box with an
antenna in return for what they find inside. It may work equally
well.

Sorry for the lengthy answer that sums up to "maybe," short questions
often require even more elaboration to upgrade to "perhaps."

> Al, the usual

Hi Al

The gain of an antenna is related to its radiation pattern shape.
When the signal ois divided between several antennas, the "gain" of the
system is lowered.

For instance, when the "gain" of the antenna is the result of its
directuivity being restricted to 180 degrees azimuth, and the second
(identical) antenna is mounted to cover the other 180 degrees, the "gain of
the both" is 3 dB. lower than the gain of either antenna alone.

If the "remote cities" produce signals that are weak enough that you are
required to have antenna gain to receive them, you may need a switch that
disconnects all but one antenna for channels from that city.

You're right, it isn't very directional but it has a reasonable front-
to-back ratio.

All I can say is I've been using Winegard antennas since 1974 and have found them to be well built good performers and have never been disappointed with their products. Also, any friends who took my advice were never disappointed with either the antannas OR me.

Sorry, typo error. I mean't the SS-1000 and SS-2000 (amplified). It
does list the "Sharp Shooter" which is a different indoor antenna.

What's inside the SS-1000 and some really weird "gain" tests:
<http://www.hdtvexpert.com/pages/squareshot.htm>

>As I said, I use it 35 miles out from Mt Wilson (Los Angeles) and have
>it split 4 ways - no preamps. I do have Line Of Sight (just barely)

Yes, but the original poster may not have such an ideal location.

Also, bad guess on the beamwidth. It's 54 (channel 69) to 95 (channel
7) degrees. Sorry.

>You're right, it isn't very directional but it has a reasonable front-
>to-back ratio.

It varies with frequency. It's only 2.6dB at channel 10. See specs
below.

>All I can say is I've been using Winegard antennas since 1974 and have
>found them to be well built good performers and have never been
>disappointed with their products. Also, any friends who took my advice
>were never disappointed with either the antannas OR me.

I try to avoid shopping by brand. Even the best manufacturers have
their lemons and losers. Right now, the advertising trend is to
replace your existing antenna with an HD or Digital TV antenna,
whatever that means. Also, to make it look like a DBS dish, which is
generally accepted by most HOA.

Specs and details:
<http://www.winegarddirect.com/pdf/spec_ss1000-ss2000.pdf>
<http://www.winegarddirect.com/squareshooter-ss1000-ss2000/winegard-square-shooter.htm>
<http://www.winegarddirect.com/viewitem~p~ss-1000~d~Winegard-SS1000-SquareShooter-UHF-Only
-DigitalAnalogHDTV-Antenna-System-(SS1000)~post~.htm>
I don't see much to complain about in the design and construction of
this antenna. However, whether it's suitable for the OP's location

and application is unknown.

It employed 20 equations with 20 unknowns. Can you name THREE?

Let's skip that, because you can not, of course.

It was recast as quaternions - I won't ask the impossible from you to
state TWO.

You have yet to manage how long it took for ONE electron to travel
end-to-end on Hertz's first loop.

So answering your questions is like sending Cuisinart to Darfur. Do
you know what electricity is like there? Any year?

both. when the current is high in the center it is creating a stronger
magnetic field, and when that current reaches the end it creates the highest
voltage so makes more electric field... both are part of the
electro-magnetic wave.

sure, its the same as today. since his equations still work the electricity hasn't changed.

TV Fool azimuth plot:

<http://i44.tinypic.com/2a4wghx.jpg>

Was considering 3 antennae with wide reception angles pointed generally at
45, 140, 310 deg. Only 3 are LOS (15, 18, 33)

Pretty flat terrain, no tall structures nearby . Top of the mast: 14 ft. agl.

Thanks.

It's antenna 'M', the Square Shooter

I don't expect it to be usable where I'm at for channels 7,9,11 and
13. I'll try it and if / when it fails, I'll tie in the VHF of the
Winegard in the garage eaves. Hopefully its VHF performance will make
the grade under the roof 'chaff'. If the wife would put up with the
all channel garage antenna on the roof, it would certainly be fine BUT
she doesn't want to look at it, hence the SS-1000 at least for the
UHF.

You won't find any new Sony at our house but you will find 4 Gigabyte motherboards with AMD processors, 3 old Technics receivers, 8 Advent speakers, Canon cameras and a lot of who knows what. When one of the brands falls short I'll re-evaluate but for now I'm happy.

Another way to put this:

The actual mean drift velocity for electrons at any reasonable curent
is quite low because there are so many of them in the conductor.
However, the electric wave driving them propagates at he speed of
light appropriate for the medium.

The electrons move hardly at all at RF/AC frequencies.
On the average, they tend to oscillate mostly in place.
What travels at the speed of light are the photons
emitted by the oscillating electrons. The electrons
form the equivalent of a "bucket brigade" for the
photonic wave energy.

Cecil
Does that mean that a radiator reduces mass with use
because the electrons orbiting around the atom are losing mass?
You are basically stating that an electron in orbit is travelling at
the speed of light
which thus imparts the same velocity to a photon which there fore also
has mass
since it has the same speed as the electron in orbit! Something wrong
there!

And for the other gentleman, what exactly is an electric wave?
Does it stay in place or does it leave the radiator?
Does it have mass such that the radiator gets lighter in use?
It is beginning to appear to me that hams are not sure what creats
radiation
and what constitutes radiation!

Gentleman,
People are so glib when they speak of the speed of light.
When a time varying current is applied to a conductor there are
several reactances involved by that conductor.
One of them has the same characteristic speed which is often
attributed to light. It is this characteristic speed of an item that
impacts another item and thus imparts the same speed to that which is
impacted. Obviously that which is impacted is responsible for the
emission of light when it enters a resistive medium as latent energy
is distributed during the transition from potential to kinetic energy.
It also posseses a charge which is accellerated! Does that ring a
bell? I suggest you investigate the speed of capacitor discharge first
to see if that is possibly the instigator of such high speed and move
on from there

That one is all over the internet. It works OK, but you would
get better results with copper wire, not steel coat hangers.
It also looks ugly.

For another idea, do a google for a Hoverman style antenna.

Then there is mine...

http://mysite.verizon.net/g_reeder/Content/DTV_antenna.html
